MISSOURI SECTION

H. F. WAHLGREN
ST. LOUIS, MO.

VOL. XLVIV JANUARY 1945 No. 1

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

Temperature and precipitation both averaged below normal, for the State as a whole, during January, while the snowfall averaged more than normal. Much cloudy and damp weather prevailed and it was the second consecutive month that farm work was kept at a standstill. Sunshine was again deficient for the third straight month.

Temperature extremes were not unusual, although rather sudden changes occurred; only two or three days separated the warmest and coldest days of the month, at many stations. The Northern and Southeastern Divisions had monthly averages of approximately 1° and 2°, respectively, less than their normals, while the Southwestern Division averaged 0.6° warmer than normal. The first two and the last two days of the month and the 9th and 10th were decidedly cold, averaging 15° to 20° below normal. The warmest period was from the 12th to 14th, while another period of moderate warmth prevailed from the 18th to the 27th. As a rule, the 9th was the coldest day of the month and the 11th, 12th, 13th, and 25th were the warmest.

Precipitation occurred as both rain and snow, being particularly heavy in the latter form in the extreme northeastern counties, where the monthly snowfall totals ranged from 9 to over 18 inches. Across the central third of the State the monthly snowfall was light to moderate. In the area of heaviest snowfall the ground was snow-covered during practically the entire month. Elsewhere the ground was bare much of the time. The monthly precipitation was irregularly distributed and each of the three divisions of the State had sub-normal monthly averages, ranging from 0.60 inch for the Northern Division to 1.85 inches for the Southeastern Division. Sleet and glaze occurred rather frequently, but were not as heavy, or frequent, as last month.

Rivers of the State did not reach flood stage at any time and there were no damaging storms during the month.

Wheat and grass remained dormant throughout the month. The prevailing unfavorable weather was not conducive to carrying on farming activities and very little work of this type was accomplished. Some corn and other feed, as well as some cotton, remained in the fields at the close of the month. Livestock fared well, but were on feed most of the month, there being very little open weather favorable for foraging, particularly over the northern half of the State. Alternate thawing and freezing kept fields and dirt roads slippery and muddy most of the month.—M. R. W.

TEMPERATURE

The monthly mean for the State, 94 stations reporting, was 30.0°, or 0.8° lower than the 58-year January average. The highest monthly mean was 36.1° at Neosho, and the lowest was 20.0° at Memphis. The highest reported was 65° at Ozark Beach on the 13th and at Caruthersville on the 25th and 26th, and the lowest was 12° below zero at Albany, on the 31st.

PRECIPITATION

The average for the State, 211 stations reporting, was 1.08 inches, or 1.22 inches less than the 58-year January average.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Farber is Laddonia; Hailey is Cato; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Pineview Lookout is Duke; Sugar Camp Lookout is Cassville; Wilderness Lookout is Lampe.

(Continued from page 1)

The greatest monthly amount was 3.52 inches at Deering, and the least was 0.23 inch at Harrisonville. The greatest amount reported in 24 hours was 1.41 inches, at Deering, on the 6-7th. The average number of days with 0.01 inch, or more, was 7.

Snowfall averaged 5.4 inches, or 0.9 inch more than the 54-year January average. The greatest monthly total was 18.7 inches at Canton.

MISCELLANEOUS PHENOMENA

Fogs.—Heavy, 1st, 4th, 5th, 6th, 7th, 8th, 12th, 13th, 14th, 15th, 16th, 17th, 19th, 20th, 21st, 22d, 23d, 26th, 28th, 29th.

Glaze.—1st, 5th, 6th, 7th, 8th, 17th, 18th, 19th, 21st, 22d, 25th, 26th, 27th.

Sleet.—2d, 6th, 7th, 8th, 9th, 13th, 14th, 15th, 17th, 18th, 19th, 21st, 22d, 25th, 27th.

Windstorms.—No damaging windstorms reported.

ERRATA

November 1944, page 67: Average hourly wind velocity at St. Louis should be 12.1. December 1944, page 74: Total snowfall at Springfield should be 3.0. Greatest 24-hour precipitation and date at Clinton should be 0.52 on 4-5th. Page 75: Greatest 24-hour precipitation and date at West Plains should be 0.94 on 6-7th.

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Wind-shield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. ‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for January 1945

(See precipitation data in daily precipitation table)

VOL. XLVIV FEBRUARY 1945 No. 2

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

APR 4 1945

GENERAL SUMMARY

February was mild, and wet over much of the State, and was the fourth consecutive month of the current winter with a marked deficiency in sunshine. Some farm work, including preparation for spring seeding, was accomplished during the second week, but otherwise farming activities continued at a standstill, because of wet soil, or freezing weather.

Although the average temperature for the State was 2.2° above normal, the current month averaged 2.4° colder than February one year ago and 3.6° colder than February 1943, both months being unusually mild. Thus, this is the third mild February in as many years. The extreme high temperature of 85° this month has been exceeded only three times in the past 58 years and equalled once, while the extreme low of 13° below zero has been equalled, or exceeded, numerous times. Cold periods occurred from the 1st to 3d, 17th to 20th, and the last three days of the month. An unusually mild period prevailed from the 9th to the 15th, inclusive, when daily temperature averages ranged from 10° to 20°, or more, warmer than normal. Another mild period occurred from the 21st to 25th. The 14th and 15th were the warmest days, as a rule, while the 1st was generally the coldest day of the month. Each of the three divisions of the State had temperature averages approximately 2.0° warmer than their respective normals; however, a few stations in each division had monthly averages slightly below normal.

Precipitation was rather frequent and very irregularly distributed, occurring as rain, sleet and snow. For the State, as a whole, it was the wettest February since 1908 and the third-wettest of record, since records began in 1888. Over the Northern Division the average was 0.19 inch less than normal, while the Southwestern and Southeastern Divisions averaged 2.17 inches and 3.84 inches, respectively, more than normal. In the Southeastern Division it was the wettest February in the 58 years that records are available, while for the Southwestern Division it was the third-wettest of record, for the same period of time. Monthly totals of more than ten inches occurred at one station in each of the latter two divisions, and 24-hour falls of approximately four inches occurred on the 25-26th at a few stations. Minor floods occurred in the Current and Black Rivers and in the Mississippi, below Cairo, during the last few days of the month; overflows continued into March.

Snowfall was particularly heavy in a belt extending across the central part of the State, in counties bordering the Missouri River, and adjacent counties, from Saline eastward to the Mississippi River. Monthly totals in this belt ranged from approximately 8 inches to as much as 15 inches. The bulk of these monthly totals fell during one storm, the 16-17th, and hampered rail and motor traffic for a short time. This snow melted within a few days, leaving the ground very muddy and waterlogged. Sleet and glaze were unusually frequent during February. The only damage reported by glaze occurred on the 21st at Maryville, where trees and wires suffered some damage and on the 26th at Koshkonong, where trees and wires were heavily damaged. A rather heavy fall of sleet occurred over much of the Southeastern Division on the 26-27th.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Farber is Laddonia; Hailey is Cato; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Pineview Lookout is Duke; Sugar Camp Lookout is Cassville; Wilderness Lookout is Lampe.

(Continued from page 9)

There were no windstorms nor hailstorms of a damaging nature during the month. A rather unusual phenomenon occurred on the 16th when thunder and lightning occurred during a heavy snowstorm in the east-central portion of the State.

During the warmer periods of the month growth of wheat and grass was started and these were becoming green. However, due to wet and muddy fields, very little grazing of livestock was possible. Some plowing was accomplished during the second week, but only for a few days. During the remainder of the month the ground was too wet to work, as a rule. Fruit buds were still dormant at the close of the month and came through the winter in very good shape. A large fruit crop was anticipated, provided later damage by freezing did not occur. Livestock were generally in good condition and supplies of available feed were ample.—M. R. W.

TEMPERATURE

The monthly mean for the State, 94 stations reporting, was 35.5°, or 2.2° warmer than the 58-year February average. The highest monthly mean was 41.5° at Campbell, and the lowest was 27.8° at Memphis. The highest reported was 85° at Arcadia on the 15th, and the lowest was 13° below zero at Canton on the 1st.

PRECIPITATION

The average for the State, 212 stations reporting, was 4.05 inches, or 1.94 inches more than the 58-year February average. The greatest monthly amount was 10.38 inches at Elijah, and the least was 0.42 inch at Chillicothe. The greatest amount reported in 24 hours was 4.85 inches, at Greenville on the 25-26th. The average number of days with 0.01 inch, or more, was 9.

Snowfall averaged 5.1 inches, or exactly normal. The greatest monthly snowfall was 15.0 inches at Boonville (river station).

MISCELLANEOUS PHENOMENA

Floods.—In Black River, at Poplar Bluff, on 24th and continued into March. In Current River, at Doniphan, on 23d; also on 27th and continued into March. In Gasconade River, at Jerome, on 23d. In Meramec River, at Pacific, on 24th. In Mississippi River, at Cairo, Ill., and below, on 24th and continued into March.

Fogs.—Heavy, 1st, 2d, 3d, 4th, 8th, 10th, 11th, 13th, 14th, 15th, 20th, 21st, 28th.

Glaze.—2d, 3d, 4th, 7th, 11th, 15th, 16th, 17th, 19th, 20th, 21st, 25th, 26th, 27th, 28th.

Hail.—Light, on 16th at Appleton City, Bolivar, Clinton, Cook Station, Fort Leonard Wood, Greenville, Joplin, Lockwood, Marshfield, Neosho, Nevada, Pleasant Hill, Roby, Saunders Tower, Springfield, and Summersville; on 26th at Advance and Fort Leonard Wood.

Sleet.—2d, 3d, 4th, 7th, 11th, 16th, 17th, 19th, 20th, 21st, 22d, 23d, 25th, 26th, 27th, 28th.

Windstorms.—No damaging winds reported, but high winds occurred on several days.

OBITUARY

Miss Carrie Loomis, Cooperative Observer at Lexington since July 1927, died January 26, 1945. During this time Miss Loomis served the Weather Bureau faithfully and well and the Bureau is deeply indebted to her for this public service of maintaining the continuity of the climatic record for Lexington, Mo.

ERRATA

November 1944, page 68: Date of greatest 24-hour precipitation at Birch Tree and Kansas City University should be 3-4th, and 2-3d, respectively. Days with .01 inch or more of precipitation at Tarkio should be 6.

January 1945, page 1: Line 6 of second paragraph the 0.6° should be 0.5°. Percentage of sunshine at Springfield should be 40. Page 2: Date of greatest 24-hour precipitation at Tarkio should be 21†.

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Windshield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. ‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for February 1945

Vol. XLVIV — March 1945 — No. 3

Price: 5 Cents a Copy; 25 Cents a Year

GENERAL SUMMARY

March was unusually warm and wet and it was the first month since October with sunshine normal or above. It was the fourth-warmest month of its name in the past 58 years, only March of 1938, 1910, and 1907 having a higher monthly average. Also, it was the wettest March of record (1888-1945), except for 1898, when the State average precipitation was exactly the same as for the current month, 7.44 inches. There were no destructive storms during the month, only one local minor windstorm being reported.

Daily temperatures averaged warmer than normal, except from the 6th to the 8th, when the only cold period of the month occurred. The 7th was the coldest, and the 16th and 27th were the warmest days of the month, generally. No freezing temperatures occurred, as a rule, after the 10th. All three divisions of the State had monthly averages of approximately eight degrees above their respective normals. There were no unusual extremes of temperature, for the month as a whole, however at some stations the highest for a given day was equalled or exceeded on the 16th.

The frequent and heavy to excessive precipitation resulted in one or more overflows in most streams of the State, especially those in the southern half, inundating lowlands and making it impossible to do any seasonal work, such as preparing the ground for spring plantings. Even on higher ground plowing and planting operations were seriously curtailed and interrupted by the frequency of the rains, with the result that very little planting of early truck and field crops, and gardens was accomplished. The excess of precipitation was general over the entire State. The Southeastern Division received the most precipitation with an average of 10.25 inches, while the Southwestern and Northern Divisions received 6.98 inches and 5.10 inches, respectively.

Snowfall during March occurred on only one or two days, the 6th and 20th, as a rule. Over the southern third of the State the fall was generally too light to be measurable, while over the Northern Division monthly totals ranged from a Trace to as much as 9.0 inches. Some stations had no snowfall during the month. All of the snow quickly melted and the ground was not covered for any appreciable time at any station.

All grass and fall-sown small grains made rank growth during March, and were in excellent condition at the close of the month, except on overflowed lowlands. Fruit trees bloomed profusely and unusually early this year and there was much apprehension that a later frost, or freeze, would ruin or seriously impair the best prospect in recent years for a large fruit crop. Very few oats were sown during the month, because of the continued wet weather, and all field work, including the planting of potatoes and early gardens was interrupted or delayed for the same reason. A prolonged period of warm, dry weather was badly needed at the close of the month, in order that the seasonal work of plowing and planting could get underway and proceed without interruption.—M. R. W.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Farber is Laddonia; Hailey is Cato; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Pineview Lookout is Duke; Sugar Camp Lookout is Cassville; Wilderness Lookout is Lampe.

(Continued from page 17)

TEMPERATURE

The monthly mean for the State, 96 stations reporting, was 52.6°, or 8.6° warmer than the 58-year March average. The highest monthly mean was 57.2° at Campbell, and the lowest was 46.5° at Tarkio. The highest reported was 89° at St. Charles, on the 16th, and near Licking, on the 29th, and the lowest was 2° at Grant City and Lawson, on the 7th.

PRECIPITATION

The average for the State, 211 stations reporting, was 7.44 inches, or 4.19 inches more than the 58-year March average. The greatest monthly amount was 15.91 inches at Jackson, and the least was 2.54 inches at Grant City. The greatest amount reported in 24 hours was 3.83 inches, at Fort Leonard Wood, on the 24-25th. The average number of days with 0.01 inch, or more, was 12.

Snowfall averaged 1.0 inch, which is 2.0 inches less than the 55-year average for March. The greatest monthly snowfall was 9.0 inches, at Paris.

MISCELLANEOUS PHENOMENA

Earthquake.—On 27th; of slight intensity; felt in Franklin, St. Louis, and Warren counties.

Floods.—In Black River; continued from February to March 2d; March 6th to 9th; 20th to 22d; 31st and continued into April. In Bourbeuse River, on 5th. In Current River; continued from February to early in March; March 7th to 8th; 31st and continued into April. In Gasconade River; on 5th; 7th to 9th. In Grand River; 16th to 18th; on 20th; 25th to 30th. In Meramec River; 3d to 10th; on 22d; 26th to 28th; 31st and continued into April. In Mississippi River; at Cairo, Ill., and below, continued from February into April; above Cairo, 19th and continued into April. In Missouri River; from Waverly to mouth 21st and continued into April. In Osage River; 21st to 22d; 25th to 27th.

Fogs.—Heavy, 1st, 2d, 5th, 6th, 7th, 8th, 10th, 12th, 13th, 15th, 16th, 30th, 31st.

Glaze.—5th, 6th.

Hail.—Light, on 5th at New Florence; 6th at Joplin; 11th at Amity and Maryville; 14th at Maryville; 16th at St. Joseph; 18th at Warrensburg and Koshkonong; 19th at Warrenburg; 24th at Amity, Columbia and vicinity, Kansas City, Lawson, Appleton City, and Lockwood; 29th at Lockwood and Farmington. Moderate, on 19th at Lockwood.

Sleet.—5th, 6th, 7th, 20th.

Windstorm.—On the 25th at about 2:00 a. m. C. W. T., a damaging windstorm struck the vicinity west and northwest of Warrenton, Warren County, resulting in damage to dwellings, outbuildings, and trees, of undetermined amount. The storm came from the southwest, with path one and one-half miles wide and about twenty-five miles in length. High winds also occurred on several days during March, but no other damage was reported.

ERRATA

December 1944, page 74: Maximum temperature and date at Warrenton should be 55 on 20th. Page 75: Monthly wind movement at Columbia evaporation station should be 1932.

February 1945, page 11: Greatest 24-hour precipitation at West Plains should be 4.51 on 25–26th.

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Windshield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. ‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for March 1945

(See precipitation data in daily precipitation table)

GENERAL SUMMARY

April 1945 was an unusually wet month, particularly over the Southwestern and Southeastern Divisions. It was the wettest April since 1927 and the third-wettest month of its name in the past 58 years. For the three-month period, February, March, and April of this year, precipitation averaged more than for any comparable period since State-wide records were begun in 1888, for the State as a whole. An average of 19.24 inches of precipitation fell during those three months of this year as compared to 15.68 inches in 1927, the previous wettest comparable three-month period.

The precipitation this month was unusually frequent, occurring on an average of fourteen days, for the State as a whole, and only in 1927 has this frequency been equalled in April. Several stations had measurable rain during the current month on fifteen to twenty days. Heavy to excessive local rains caused serious soil erosion in fields that had been previously plowed, or worked, some stations reporting falls of four and five inches in a twenty-four hour period.

Snowfall was of little consequence during April, measurable amounts of one inch or less, being confined to a few extreme northwestern counties. Elsewhere monthly totals were only a trace, with most stations in the southern half of the State reporting no snow.

Severe flood conditions which prevailed during much of March continued throughout most of April, in the lower Missouri River and in the adjacent Mississippi River, as well as in all rivers and streams in the southern half of the State. Severe overflows also occurred in most streams in the northern half of the State during the month, but the duration and frequency of the overflows in that area were not so prolonged, nor so frequent as in the southern half, where the April rainfall was heavier.

Temperature averages were exactly normal for both the Northern and Southwestern Divisions, while the Southeastern Division and the State averaged 1.4° and 0.6° warmer than normal, respectively. A decidedly cool period occurred from the 4th to 6th, when minimum temperatures dropped to freezing and below, quite generally, and heavy to killing frosts caused some damage to fruit, which was unseasonably advanced, over much of the State, except in the extreme southerns portions. Other cool periods occurred from the 17th to 19th and the last week of the month, while the first three days of April and from the 7th to 13th were warm periods. Very little freezing occurred after the 6th, as a rule, although light to heavy frosts formed later in the month, but generally without damage. There were no unusual extremes of temperature reported.

Sunshine averaged considerably less than normal, except over the eastern third of the State, where it was only slightly less than normal.

Several destructive small tornadoes, hailstorms, and local windstorms occurred during the month, principally on the 12th, 13th, and 16th; described in detail elsewhere in this issue.

The frequent and generally moderate to heavy precipitation during the month kept fields too wet to work most of the time, and seasonal work of plowing and planting was seriously interrupted. This work was from four to six weeks behind the usual stage of advancement at the end of April. Very little corn had been planted and less than one-half of the intended oat acreage was seeded, because of continued wet fields. All small grains made good growth and development, but were showing the effects of too much moisture and lack of sunshine and warmer weather at the close of the month. Gardens and truck crops were unusually late and many gardens had not even been plowed. Those that were planted earlier made little growth and progress. Many potatoes also had not been planted at the close of April. All fruits were unusually far advanced for the time of year and much damage occurred in some sections of the State, as a result of the hard freeze and frost on the 5th and 6th. All grasses made fair to good growth and provided ample pasturage for livestock, but needed sunshine and warmer weather the latter part of the month for best grazing results. Cotton planting in the extreme southeastern counties was seriously curtailed by the persistent wet weather, and much of the acreage intended for this crop was expected to be planted to beans or other crops because of the lateness of the season.

It is doubtful if there ever was a spring that offered so many hindrances to agriculture as the current one, with its unprecedented rainfall, frequent and prolonged overflowing of rivers and streams, and labor and material shortages, and this in the face of urgent and increasing demands for increased production of all crops and livestock, for home and foreign consumption.—M. R. W.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. ^{4} Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Farber is Laddonia; Hailey is Cato; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Pineview Lookout is Duke; Sugar Camp Lookout is Cassville; Wilderness Lookout is Lampe.

(Continued from page 25)

TEMPERATURE

The monthly mean for the State, 93 stations reporting, was 55.9°, or 0.6° warmer than the 58-year April average. The highest monthly mean was 60.9° at Caruthersville, and the lowest was 49.9° at Tarkio. The highest reported was 86° at Doniphan on the 13th, and at Anderson on the 21st, and the lowest was 20° near Black on the 6th.

PRECIPITATION

The average for the State, 211 stations reporting, was 7.75 inches, or 3.71 inches more than the 58-year April average. The greatest monthly amount was 13.82 inches at Ozark Beach, and the least was 3.43 inches at Brookfield. The greatest amount reported in 24 hours was 5.19 inches at Neosho on the 12-13th. The average number of days with 0.01 inch, or more of rain, was 14.

Snowfall averaged only a trace, or 0.6 inch less than the 55-year average for April. The greatest monthly snowfall was 1.0 inch at Maryville and Tarkio.

MISCELLANEOUS PHENOMENA

Floods.—In Black River, continued from March to April 6th; April 15-19th. In Bourbeuse River, 1st-2d; 4th; 16th. In Current River, continued from March to April 4th. In Gasconade River, 1st-5th; 14-18th. In Grand River, 16th-23d; 26-27th. In Meramec River, continued from March to April 6th; April 14-19th. In Mississippi River, continued from March into May, except in the reach from St. Louis to Cape Girardeau, where it was not in flood from April 11-15th. In Missouri River, at Hermann and below, continued from March to April 5th; April 15th and continued into May; in the reach from Kansas City to Waverly, 17-20th. In Osage River, on 1st; 15th and continued into May. In St. Francis River, at Fisk, continued from March into May. In White River, at Ozark Beach, 15-17th.

Fogs.—Heavy, 3d, 12th, 14th, 15th, 20th, 24th.

Frosts.—Light, 5th, 6th, 7th, 17th, 18th, 19th, 26th, 27th, 29th, 30th; heavy, 5th, 6th, 17th, 18th, 19th, 26th; killing, 4th, 5th, 6th, 18th.

Glaze.—3d, 4th.

Hail.—Light, 4th near Alton, Farmington, Macedonia Lookout; 11th at Browning and Jefferson City; 12th at Altona, Anderson, Steelville; 13th at Bowling Green, Brunswick, Hannibal, Altona, Lockwood, Marshall, Roby, Salem, Sturgeon; 14th at Fulton; 17th at Amity and Browning; 20th at Kansas City, Saverton, Steffenville; 21st at Lockwood. Moderate, 27th at Seligman. Heavy, 13th at Louisiana, Fayette, and Bolivar. (See special hailstorm notes).

Sleet.—4th, 5th, 6th, 20th.

Tornadoes.—12th. (See special tornado notes).

Windstorms.—9th, 12th, 13th, 16th, 25th. (See special windstorm notes).

HAILSTORMS

Heavy hail fell at Fayette at 6:35 p. m. (C. W. T.) on the 13th, over a path two miles wide and across most of Howard County from west to east, a distance of about twenty miles. Stones ranged from one-half inch to one and one-half inches in diameter and were as large as hulled, black walnuts. Property damage paid by insurance adjusters amounted to $3,600. Crop loss was to fruit and gardens, but amount of this damage not reported. This storm was accompanied by severe wind, but no great damage occurred therefrom.

Heavy hail also fell on the 13th at Bolivar from 3:15 p. m. to 3:22 p. m. (C. W. T.) and again from 6:55 p. m. to 7 p. m. (C. W. T.), over a path two miles wide and five miles long, extending from southwest to northeast. Some stones ranged up to as large as two inches in diameter, and many stones were one and one-fourth inches across. Severe damage resulted to fruits, small grains, and gardens, estimated at $7,000 to $8,000. Property damage to smooth asphalt roofs, window glass, greenhouse glass, and soft-type automobile tops was great, but estimate of damagenot reported.

Heavy hail fell at Louisiana on the 13th from 4:55 p. m. to 5:15 p. m. (C. W. T.), and was preceded by a moderate fall from 4:20 p. m. to 4:40 p. m. (C. W. T.). Path of this storm was one mile wide and one mile long, and movement was from southwest to northeast. Stones were one and one-half to two inches in diameter. Property damage was estimated at $150,000 to $200,000. Crops were not affected as the hail area was within the city limits. The hailstorm was accompanied by a heavy fall of rain.

TORNADOES

A series of three, or more, tornadoes struck locally in southwestern and northeastern counties of the State, between 7:00 p. m. and 10:00 p. m. (C. W. T.) on the 12th, resulting in seven deaths, injury to seventy-four persons, and property damage estimated at between $525,000 and $675,000. Crop damage was negligible. These tornadoes were evidently a continuation of similar storms which occurred in Arkansas and Oklahoma, earlier the same day, and which moved in a northeasterly direction across Missouri and into Illinois, alternately lifting and descending along the path of progression.

High winds, thunderstorms, and driving rain prevailed along a rather wide belt along the storm's path, in addition to the tornadoes that struck at various points.

The first of these tornadoes struck south-central McDonald County, at Pineville about 7:00 p. m. (C. W. T.), and moved northeastward to near Stella. One woman was killed, fifteen persons were injured and property damage was estimated at between $50,000 and $75,000 in that county. The path of this storm was from 300 to 600 feet wide and about twelve or fourteen miles in length, with the tornado lifting and descending along its course from Pineville to Stella.

A part of the same tornado, or a separate one, struck nine miles west-southwest of Mount Vernon, Lawrence County, at the same time as the one at Pineville, resulting in the death of one person, injury to six others, and property damage estimated at $150,000 to $175,000. The path of this storm was about one mile wide and about eight miles long, extending in a general northeasterly direction. The tornado then apparently lifted and did not strike again until it reached Morrisville, Polk County, at 8:45 p. m. (C. W. T.), where it dipped to earth, resulting in death to four persons, injury to sixteen others, and property damage

(Continued from page 27)

estimated at one-quarter of a million dollars. The tornado path at Morrisville was 300 yards wide and about three-fourths of a mile in length and extended in a northeasterly direction.

Still another tornado, or probably two separate ones, struck about three miles south of Bradleyville, Taney County, and at Ava, Douglas County, extending northeastward into Wright County, at about 9 p. m. (C. W. T.). It is possible, and highly probable, that this storm, or storms, originated in Arkansas. Near Bradleyville, two persons were reported injured, while at Ava, ten or twelve persons were injured. The path of this storm varied from 100 yards to one-half mile in width and was about thirty-two miles in length, but the tornado was not in contact with the ground throughout its entire length, alternately lifting and descending along the path. Buildings and fences were reported damaged, but amount of damage was not given.

The last of this series of tornadoes of the 12th, in Missouri, struck at Palmyra, Marion County, at 10 p. m. (C. W. T.), and crossed the Mississippi River into Illinois. At Palmyra there were no fatalities, but eleven persons were injured and property damaged was estimated at between $200,000 and $300,000. The path of this tornado was four or five blocks wide and approximately one-half mile long, extending in a southwesterly to northeasterly direction. Soon after striking Palmyra the tornado apparently lifted and did not strike again until it reached Quincy, Illinois, about ten miles northeast of Palmyra.

WINDSTORMS

A minor windstorm was reported at Browning on the 9th, with only slight damage.

On the 12th a windstorm struck Jefferson City, damaging wires, trees, roofs and porches, estimated at "thousands of dollars". The storm came from the southwest, with path one-half mile wide and of unknown length. One person was reported injured.

On the 13th, between 7 and 8 p. m. (C. W. T.), a windstorm accompanied by heavy rain and hail, struck the vicinity of Sturgeon, Boone County, damaging outbuildings and flooding streams, cellars, and basements. No details of this storm, or amount of damage was available, but apparently damage was slight.

On the 16th, damaging windstorms occurred at several places in the State. At Browning slight wind damage occurred. At Bolivar, roofs, that had been damaged previously on the 13th by hail, suffered additional damage from a high southwest wind on the 16th, but amount of additional damage not reported. At Columbia many trees were blown down, limbs broken off, and power and communication lines were broken and service disrupted in various sections of the city. Damage was mostly of a minor nature. At St. Louis and in St. Louis County high winds, with gusts up to 60 m. p. h., damaged or felled numerous trees, blew out the walls of four buildings, broke plate glass windows, damaged roofs, cornices, automobiles, signs, billboards, smokestacks, and slightly injured two persons. Damage was estimated at several thousand dollars, most of which occurred in the city.

A windstorm on the 25th struck the southern half of Shannon County, resulting in damage to houses, barns and trees at Birch Tree, Winona, and Low Wassie. The storm came from the southwest, with path three miles wide and twenty miles long. No amount of damage reported.

DEATH FROM LIGHTNING

On the 12th a boy was reported struck and killed by lightning at Everton, Dade County, Mo.

ERRATA

January 1945, page 2: ~~Maximum~~ Minimum temperature and date at Appleton City should be 7 on 1st. Days clear, partly cloudy, and cloudy at Birch Tree should be 12°, 6°, and 10°, respectively. Total snowfall at Fort Leonard Wood should be 4.9. Date of maximum temperature at Lamar should be 11.

ST. LOUIS, MO.

Vol. XLVIV   May 1945   No. 5

Price: 5 Cents a Copy; 25 Cents a Year

GENERAL SUMMARY

May was decidedly cool this year and it was also wetter than normal, making it the fourth consecutive month of 1945 with above average precipitation. Precipitation for the four months, February to May, inclusive, of the current year averaged 24.74 inches, which is the wettest of record (1888-1945) for that period of time. The previous wettest comparable four-month period was in 1927 when the average was 22.63 inches, while in 1892 the same four months averaged 22.16 inches. By contrast the average for 1936, for a similar period, was only 7.74 inches, or approximately 30 percent of this year's average.

The precipitation during the month was quite frequent, occurring on an average of 12 days, for the State as a whole, while a number of stations had measurable rain on 15 or 16 days in May. The distribution was rather irregular, ranging from a total of 9.24 inches in the extreme northwestern corner of the State to 1.79 inches in the northeastern portion. The Southwestern Division received the most rainfall during the month, with an average of 6.20 inches, while the average for the Southeastern and Northern Divisions was 5.50 inches and 4.79 inches, respectively. These averages are approximately one inch above the normals for the respective divisions, except for the Northern, where the May average was only slightly above normal. Heavy to excessive local rains of three to four inches, within a twenty-four hour period, resulted in rapid rises and overflows in smaller streams and creeks and caused serious washing of plowed fields.

The major streams of the State, particularly the lower Missouri, the Mississippi, and the St. Francis Rivers, were at high stages or in flood during much of the month, although crests were not as high as in April. The frequency and duration of flood conditions in this State the past three months has probably never been as serious in the climatic history of the State.

The State average temperature for May, 60.5°, was the lowest since 1935, and it has been lower in only five Mays during the past 58 years. The sub-normal temperatures were general in all divisions of the State, not a single reporting station having a monthly mean normal or above. A number of stations reported minimum temperatures below freezing, especially in the Northern and Southwestern Divisions, with light frost forming, but no damage reported. The 5th and 6th were generally the coldest, and the 20th and 31st the warmest days of the month. Only a very few days had average temperatures normal or above, and there were no outstanding warm periods. The first eleven days of the month and the 15th to 19th were decidedly cool periods. The extreme maximum of 92° for this month was the lowest State maximum for May in the past nine years, and it has been lower only three times since 1888, and then by only one degree.

Sunshine averaged considerably below normal and there were an average of eleven cloudy days for the State, as a whole. Hail was especially frequent during May, with very destructive occurrences locally on the 14th, 24th, and 29th. No tornadoes were reported, but a number of minor windstorms occurred on several days.

(Continued on page 35)

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ᵃ, ᵇ, ᶜ, etc., number of days missing; for example, ᵇ, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. ⁴ Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Farber is Laddonia; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Pineview Lookout is Duke; Sugar Camp Lookout is Cassville; Wilderness Lookout is Lampe.

(Continued from page 33)

The cool wet weather during May was very unfavorable from an agricultural viewpoint, further delaying plowing and planting of field crops. Only about twenty-five percent of the intended corn crop had been planted at the close of the month. Wheat was showing the affect of too much moisture and lack of sunshine, and rust was developing in many fields. Oats and grass made good growth and progress, but needed warmer weather and more sunshine for best results. Frequent showers seriously interfered with the cutting and curing of alfalfa hay and much of this crop was ruined after being cut. Gardens and truck crops made only fair progress and were also in need of warmer and drier weather throughout much of May. Much fruit was knocked or blown off the trees, by hail and windstorms, in scattered localities. The outlook for a good crop year was very discouraging at the end of the month.—M. R. W.

TEMPERATURE

The monthly mean for the State, 96 stations reporting, was 60.5°, or 4.0° cooler than the 58-year May average. The highest monthly mean was 65.6° at Campbell, and the lowest was 56.5° at Unionville. The highest reported was 92° at Sikeston, on the 31st, and the lowest was 31° at Albany, Tarkio, and Anderson, on the 5th, and near Black, on the 11th.

PRECIPITATION

The average for the State, 214 stations reporting, was 5.50 inches, or 0.71 inch more than the 58-year May average. The greatest monthly amount was 9.24 inches at Maryville, and the least was 1.79 inches at Palmyra. The greatest amount reported in 24 hours was 4.06 inches, at Maryville, on the 13-14th. The average number of days with 0.01 inch, or more, was 12.

Snowfall was unimportant, with only two stations reporting snowfall, and the amounts were only a trace.

MISCELLANEOUS PHENOMENA

Earthquakes.—Slight, 2d, 20th.

Floods.—In Grand River, 15th to 31st. In Meramec River, 30th and continued into June. In Missouri River, below Hermann, continued from April to May 1st; May 25th and continued into June; in reach Waverly to Hermann, 16th to 22d; 24th to 29th. In Mississippi River, in reach Keokuk to New Madrid, in flood at one or more points from April and continued into June. In Osage River, continued from April to May 4th; May 6th, 8th, 29th and continued into June. In St. Francis River, at Fisk, continued from April into June.

Fogs.—Heavy, 2d, 9th, 10th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 22d, 26th, 29th, 30th, 31st.

Frosts.—Light, 5th, 6th, 8th, 18th.

Hail.—Light, 1st at Anderson; 2d at Chillicothe, Kansas City, Kirksville, St. Joseph, Steffenville, Unionville; 3d at Edina; 7th at Koshkonong, near Browning, Sikeston; 9th at Hailey and near Cassville; 13th at Brunswick and Conception; 14th at Amity, Auxvasse, near Browning, Columbia, Midway, Grant City, Lawson, Martinsburg, Maryville, New Florence, St. Joseph, Shelbina, Tarkio, Warrenton, Jefferson Barracks, Moselle, St. Louis and St. Louis County, Union, Vichy, Concordia, Swan Tower Lookout; 15th at Hannibal, Mexico, Anderson; 20th at Maryville; 24th at Appleton City, Caplinger Mills, Amity, Maryville, Rolla, Concordia; 25th at Kidder, Appleton City; 27th at Columbia, Midway; 28th at Rolla, Salem, Vichy, Butler, Vanzant; 29th at Caruthersville, Rolla, Swan Tower Lookout. Moderate, 2d near Browning; 7th at Lockwood; 14th at Fayette; 15th at Boonville; 28th at Pleasant Hill. Heavy, 14th, 24th, 25th, 28th, 29th, 31st. (See special hailstorm notes).

Sleet.—2d, 3d, 9th, 14th, 15th.

Windstorms.—9th, 14th, 20th, 21st, 24th, 29th. (See special windstorm notes).

HAILSTORMS

A heavy hailstorm occurred 8 to 15 miles northeast of Sweet Springs, on the 14th (time not reported). The storm came from the northwest, and covered a path 6½ miles long and 1½ miles wide. Stones were the size of marbles, with a few ½ to 1½ inches in diameter. Damage was severe to early gardens, but property damage was very slight. Amount of damage not reported. From 4:20 p. m. to 4:38 p. m. C. W. T., the same day, a light fall of hail occurred at Columbia, resulting in property damage estimated at $100. This storm came from the

Observations taken at 8:00 a. m. except at 7:30 a. m. at Lakeside. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

(Continued from page 35)

west-southwest over a path 1 mile wide and 4 or 5 miles long. Stones were from ¼ inch to 2½ inches in diameter, with some unofficially reported up to 4 inches in diameter. The same day between 7:40 p. m. and 8:30 p. m. C. W. T., heavy and very destructive hail fell in St. Louis and parts of St. Louis County over a path 8 to 10 miles wide and about 15 miles long. This storm came from the northwest, and was accompanied by high wind and heavy rain. Stones ranged up to as large as 2¼ inches in diameter, and were especially destructive to the many greenhouses in the area, and to composition roofs and soft type automobile tops. Much fruit was knocked off trees and the trees themselves bruised and battered, and truck and vegetable gardens were considerably damaged. The damage to greenhouses alone was estimated at $200,000 and to the contents (flowers and vegetables) at $210,000. The loss to farm crops and fruits was estimated at $200,000 while no estimate of the amount of the damage to roofs, window glass, automobile tops, etc., was available, but would run into several hundred thousand dollars. Considerable damage was caused by the accompanying rain penetrating homes and buildings whose roofs had been damaged by the hailstones.

Heavy hail fell at Bear Creek and Cedar Springs, Cedar County, at 2:15 p. m. C. W. T., on the 24th, resulting in considerable damage estimated at $3,000 to crops and $2,000 to property. The storm came from the southeast over a path ½ mile wide and 20 miles long. Stones ranged from ¼ to 1½ inches in diameter. Earlier the same day at 11 a. m. C. W. T., heavy hail fell 9 miles east from Rich Hill, Bates County, with considerable damage to crops and composition roofs. Damage to wheat, oats, barley and rye averaged 40% to 50%, but monetary amount of damage not reported. This storm came from the northeast over a path 7 miles long and 4 miles wide. Stones were approximately 1 inch in diameter. The same day heavy hail occurred 6 to 10 miles northeast of Sweet Springs, but the time was not reported. Path of this storm was 1 mile wide and 4 miles long, but direction of movement was not reported. Stones ranged up to 1½ inches in diameter, resulting in considerable damage to early gardens and roofs, and killing a few chickens. Amount of damage not reported.

From 8:00 a. m. to 9:00 a. m. C. W. T., of the 28th heavy hail occurred west and east of Rich Hill, Bates County, over a path 2 miles wide and 9 miles long. Stones averaged 1½ to 1¾ inches in diameter, with some as much as 3 inches in diameter. Damage to crops and roofs was estimated at $50,000; wheat, rye, oats, and barley were damaged 30% to 40%. One report received estimated the damage from the hailstorms of the 24th

/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs. ^{a}, ^{b}, ^{c}, etc., number of days missing, for example, ^{b} indicates two days missing. Italics data interpolated. § Partly interpolated.

Continued from page 38

and 28th in Bates and nearby counties, at $100,000 to crops and $75,000 to property.

On the 29th heavy hail occurred at Marshall, and accumulated in places to a depth of about 4 inches. This storm came from the southwest, with path 1 mile wide and 4 miles long. Stones ranged from the size of small peas to 1¼ inches in diameter. Damage to crops and gardens was estimated at $25,000. Roofs and window lights were also damaged considerably, but amount of this and other property damage was not reported. The same day about 9:00 a. m. to 10:00 a. m. C. W. T., a heavy hail and windstorm struck at Marquand, Madison County, and moved across Bollinger County in a southeasterly direction, over a path averaging 3½ miles wide. Fruit, wheat, oats, and gardens were 90% ruined, and trees were battered and broken badly. Many roofs were badly damaged and numerous windows broken. Damage from both hail and wind was estimated at $75,000 to $100,000. The hailstones ranged from very small to more than 1 inch in diameter. Evidently this was part of the same storm that struck Cairo, Ill., a little later the same day.

On the 31st, at 5:00 p. m. C. W. T., heavy hail fell at Arrow Rock, Saline County, over a path ½ mile wide and 2 miles long. The storm came from the east, and stones averaged 1 inch in diameter. The resultant damage to crops was slight. Three buildings were damaged, but the amount of damage was not reported.

WINDSTORMS

On the 9th, destructive winds were reported at several places in Barry, McDonald, Newton, and Lawrence counties, resulting in property damage estimated at $40,000, and crop (fruit) damage estimated at $8,000. The winds were generally from the northwest, except in McDonald County, where they were from the southwest. At Hailey the wind was reported as rotary, but apparently this was not a tornado. Places reported as being struck by the high winds were near Cassville, Stella, Wheaton, Exeter, Mineral Springs, Cato, Hailey, and Shell Knob. The windstorm struck Hailey at 12 noon C. W. T., and near Cassville at 12:30 p. m. C. W. T. At those places the winds were accompanied by hail. The path near Cassville was reported as 8 miles wide, and at Hailey is was reported as ¼ mile wide, while in McDonald County the path was reported as "broad" and the length as about 30 miles. Apparently these were a series of two, or more, windstorms.

During the early evening of the 14th, high winds, accompanying a heavy hailstorm struck St. Louis and St. Louis County, blew down trees, barns, and wires, damaged windows, and blew out the brick wall of one building. The bulk of the damage from this storm however, was from hail, with wind damage relatively light; probably amounting to $2,000. The wind came from the northwest. Path was 8 to 10 miles wide and about 15 miles long.

On the 20th a minor windstorm struck Boonville, blowing down some trees. Slight property damage resulted.

On the 21st from 1:00 p. m. to 6:00 p. m. C. W. T., a windstorm struck Kirksville, resulting in property damage estimated at $1,000. The storm came from the south. Length and width of path was reported as unknown.

On the 24th trees were blown down at Boonville; property damage was slight.

In connection with a heavy hailstorm, an accompanying windstorm struck eastern Madison County, near Marquand, and extended southeasterly across Bollinger County, between 9:00 a. m. and 10:00 a. m. C. W. T., on the 29th. Although the bulk of the resultant damage was from hail, there was also considerable wind damage, but it was impossible to accurately segregate the wind damage from that caused by hail. However, the damage from both was estimated at $75,000 to $100,000. For further details see description of this storm under hailstorms.

ERRATA

February 1945, page 10: Mean temperature, departure, and total snowfall at Clinton should be 36.4, + 2.8, and 7.5, respectively. Total snowfall at Crystal City should be 6.5. Vol. XLVIV   June 1945   No. 6

Price: 5 Cents a Copy; 25 Cents a Year

GENERAL SUMMARY

June was both much wetter and cooler than normal, making it the fifth consecutive month of the current year with an excess of precipitation and the second consecutive month with below-normal temperature. It was a decidedly unfavorable month for seasonal agricultural activities and much of the intended crop acreage had not been plowed or planted at the close of the month.

The temperature deficiency was State-wide, each of the three divisions of the State averaging from approximately three to five degrees lower than their respective June normals. The Northern Division had the lowest monthly average with 67.4°, while the Southeastern Division had the highest average temperature with 71.3°; the average for the Southwestern Division was 69.7°. For the State as a whole, it was the coolest June since 1928 and the third-coolest in the 58 years State-wide records have been kept. Cooler Junes were in 1928 and 1903, while the monthly average in 1912 was exactly the same as for the current month. The period from the 2d to the 8th was decidedly cool, with the minimum temperatures for the month generally occurring on the 4th. The 17th to 21st was another rather cool period. There were no unusual or prolonged periods of warm weather and maximum temperatures did not go above the middle 90's anywhere in the State, which is quite unusual for June. The 27th and 28th were generally the warmest days of the month.

Precipitation was again unusually frequent and heavy, as was the case the four preceding months, making the five-month period, February to June, inclusive, of this year, the wettest five-month period in the past 58 years. For the six months, since the first of this year, some stations, particularly in the Southeastern Division, had received as much, or more, precipitation than normally occurs in a whole year; Jackson and Poplar Bluff being two stations picked at random as representative. At Jackson 48.38 inches of precipitation had fallen since January 1st, as compared to a yearly average of 46.26 inches; at Poplar Bluff 53.15 inches fell during the six-month period while the annual average there is 47.35 inches. A very heavy and excessive rain, of cloudburst proportions, fell locally at Newburg, Phelps County, on the afternoon of the 8th, resulting in a flash flood which drowned five persons and caused property damage of $277,141, (estimated by the U. S. Engineer Office at Kansas City, Mo.). Since no official rain gage was located at Newburg, or in the immediate area, no official measurements are available, but unofficial estimates of the amount of this torrential downpour vary from five to as much eight inches. Twenty-four hour amounts of rainfall of four to nearly seven inches occurred locally at several other stations during June.

The frequent and heavy rains kept most rivers of the State at unusually high levels, or in flood, during much of the month, but they were receding and generally within banks at the end of June. In the Meramec River the highest flood since 1916 occurred when the crest at Valley Park reached 33.0 feet at noon (C. W. T.) of the 11th.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ᵃ, ᵇ, ᶜ, etc., number of days missing: for example, ᵇ, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Farber is Laddonia; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Pineview Lookout is Duke; Sugar Camp Lookout is Cassville; Wilderness Lookout is Lampe.

Continued from page 41

While there were no particularly severe and destructive general storms, the occurrences of local windstorms, thunderstorms, and hail were unusually frequent. Only one small local tornado occurred.

Sunshine was decidedly deficient, particularly in the central and southwestern portions of the State, and this, together with the persistent and heavy rainfall and subnormal temperatures, was very unfavorable for planting and cultivating all crops. Much of the corn, cotton, and soybean crop had not been planted by the close of the month and that portion which had been planted was becoming grassy and weedy, and in need of cultivation, which could not be done because of continued wet fields. Hay and small grain crops made good growth, but were in need of sunshine and warmer weather most of the month. Harvest of hay was very difficult, because of the frequency of the rains, and much of this crop was lost, or damaged, after being cut. Rust in wheat was rather serious and damaged that crop considerably. Fruit prospects were good, especially for peaches, at the close of June. Because of the lateness of the season, and the large amount of planting yet to be done, agricultural conditions at the end of June were in a very critical state and an unusually extended growing season will be essential in order to produce anything like a normal crop this year.—M. R. W.

TEMPERATURE

The monthly mean for the State, 95 stations reporting, was 69.5°, or 4.1° cooler than the 58-year June average. The highest monthly mean was 74.6° at Campbell, and the lowest was 65.2° at Maryville. The highest reported was 95° at Campbell, Doniphan, and Malden,on the 27th, and the lowest was 37° at Kidder and Lawson, on the 4th.

PRECIPITATION

The average for the State, 212 stations reporting, was 8.84 inches, or 4.09 inches more than the 58-year June average. The greatest monthly amount was 17.16 inches at Greenville No. 2, and the least was 3.68 inches at Osceola. The greatest amount reported in 24 hours was 6.98 inches, at Sikeston, on the 7-8th. The average number of days with 0.01 inch, or more, was 14.

MISCELLANEOUS PHENOMENA

Floods.—In Black River, 8th to 15th; 18th to 21st. In Bourbeuse River, 9th to 11th. In Current River, 11th to 12th; 18th to 19th. In Grand River, 7th to 14th; 16th to 24th. In Meramec River, continued from May to June 1st; 8th to 15th. In Mississippi River, in reach Keokuk to New Madrid, in flood at one or more points from May into July. In Missouri River, in reach below Hermann, continued from May to June 2d; 8th to 16th; 18th to 26th; in reach St. Joseph to Waverly, 17th to 22d; in reach Waverly to Hermann, 10th to 12th; 17th to 24th. In Osage River, continued from May to June 1st; 8th to 11th; 18th to 22d. In St. Francis River, at Fisk, continued from May to June 5th; 22d and continued into July.

Fogs.—Heavy, 7th, 8th, 9th, 12th, 13th, 15th, 17th, 18th, 19th, 21st, 25th, 27th, 29th.

Hail.—Light, on 1st at Vichy, Bolivar, Marshfield, Fayette, Warrenton; 2d at Seligman; 4th at Hailey; 5th at Anderson, Shell Knob, Warrensburg, Oregon; 6th at Lockwood, Marshall, Sweet Springs, Warrensburg, Amity; 7th at Koshkonong, Rolla, St. Louis Airport, Crocker, Eldon, Harrisonville, Sedalia, Warrensburg, Auxvasse, Brunswick, Kansas City, Mexico, Steffenville; 8th at Rolla, Warrensburg, Amity; 9th at Rolla, Bolivar, Saunders Lookout, St. Joseph; 11th at Hailey; 15th at Lawson, St. Charles, St. Joseph; 18th at St. Louis Airport, Springfield, Auxvasse, Midway; 20th at Eldon; 27th at Amity, Steffenville; 29th at Albany, Conception, Mexico; 30th at Brunswick, Kansas City, Lawson, Macon. Moderate, on 5th near Oregon; slight damage to crops. Heavy, 8th, 9th, 29th-30th. (See special hailstorm notes).

Tornado.—15th. (See special windstorm and tornado notes).

Windstorms.—1st, 7th, 9th, 10th, 15th, 16th, 18th, 27th, 30th. (See special windstorm and tornado notes).

WINDSTORMS AND TORNADO

On the 1st, about 10:30 p. m. (C. W. T.), a windstorm occurred in St. Charles and St. Louis counties and in St. Louis and East St. Louis, Ill., blowing down and breaking many trees

Observations taken at 8:00 a. m. except at 7:30 a. m. at Lakeside. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

(Continued from page 43)

and wires, disrupting power and communication services, and damaging a few buildings. Much fruit was blown off trees. The storm came from the southwest over a path about 25 miles long and about five miles wide. Gusts up to 80 m. p. h., were reported by the Airport Station at Lambert Field, St. Louis County, while the maximum velocity for a five minute period at the St. Louis City Weather Bureau Office was 40 m. p. h., beginning at 10:45 p. m. (C. W. T.). No estimate of the resultant damage was available, but it would probably amount to several thousand dollars in St. Louis and in St. Louis County. The damage at St. Charles was confined to trees.

On the 7th a minor windstorm struck near Browning, shortly after midnight (C. W. T.), with damage confined mostly to trees. The wind was from the west or west-northwest. The same day trees were also damaged at Crystal City by a minor local windstorm.

On the 9th a local and minor windstorm occurred at Birch Tree, at 8:15 p. m. (C. W. T.). This storm came from the northwest, with path one-half mile wide and one mile long. The only damage was to trees.

On the 10th trees were damaged by a local windstorms at Morehouse.

During the afternoon of the 15th, between 2:30 p. m. and 3:00 p. m. (C. W. T.), extremely high winds swept across the northeastern portion of the State from south-central Sullivan County generally northeastward to the Mississippi River. The windstorm was first reported about 4½ miles east of Browning, where many barns were badly damaged, or destroyed, and innumerable outbuildings were destroyed, and much poultry was killed, when brooder houses were overturned. Some livestock was crippled and farm implements damaged by falling barns and sheds. Monetary damage estimate not available. From near Browning the storm continued its northeasterly movement, increasing in intensity, until it struck near the southwestern city limits of Kirksville at 3:00 p. m. (C. W. T.) as a small tornado. The tornado moved into the city limits of Kirksville and cut a path of greatest destruction about 100 yards wide and about one mile long in the extreme southern section of the city. The wind velocity was reported as 80 m. p. h., and five persons were injured, three houses destroyed, 50 homes damaged by loss of roofs and windows, and many small chickens were killed or drowned. Loss to crops was only slight. The amount of damage at Kirksville was not reported. Some damage occurred to the north of the main storm path, one building 18 blocks away having the roof blown off. After striking Kirksville the tornado apparently lifted and did not strike the ground again, but

/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs. [a], [b], [c], etc., number of days missing, for example, [b] indicates two days missing. Italics data interpolated. § Partly interpolated.

(Continued from page 46)

continued as a straight-line wind. At about the same time as the Kirksville tornado, (3:00 p. m. C. W. T.), damaging winds occurred over the northern half of Knox County, over a path 12 miles wide and about 25 miles long, with movement here reported as from the west. Cattle barns, houses, and trees were damaged, but the estimated amount of damage was not reported. There was no further damage reported in the State, although high winds were reported to the east of Knox County and newspaper account of this storm reported "it blew itself out near Quincy, Ill."

On the 16th, at 1:15 p. m. (C. W. T.), a local windstorm struck St. Louis and scattered sections of St. Louis County, with some minor damage to trees and wires.

On the 18th, at 3:45 p. m. (C. W. T.), a local windstorm at St. Louis broke plate glass windows in two buildings and tore a section of tin from the roof of another. Damage to one of the windows of Famous-Barr Co., was estimated at $300.

On the 27th, at 4:30 a. m. (C. W. T.), a local windstorm occurred about five miles northwest of Amity, resulting in injury to two persons and damage to the buildings on two farms. Details and amount of damage not reported.

On the 30th, about noon (C. W. T.), a destructive windstorm struck at Clifton Hill and vicinity, resulting in property damage to barns, outbuildings, and roofs, estimated at $50,000, and great crop damage, which was not estimated. The storm came from the west, with path 20 to 30 miles wide and 40 to 50 miles long. On the same day a windstorm struck at Shelbina and to the north of Shelbina, between 12:30 p. m. and 1:15 p. m. (C. W. T.), resulting in damage to property estimated at $100,000. Damage to crops here was small. The storm movement was from the southwest, over a path approximately 12 miles long and of unreported width. This may have been a continuation of the storm that struck Clifton Hill. During the evening of the same day another windstorm, accompanied by heavy hail, struck the northwestern corner of Knox County, damaging houses, barns, and other outbuildings. This storm came from the northwest and covered an area three miles wide and four miles long. Amount of property damage was not reported, but crops were severely damaged by the accompanying hail.

HAILSTORMS

Heavy hail fell in northern Boone County, in the vicinity of Sturgeon and Centralia, on June 1st between 5:00 and 6:00 p. m. (C. W. T.), over a path 9 miles long and 4½ miles wide. The storm came from the west-southwest. Stones ranged in size from small marbles to some as large as hen eggs. Damage to crops was estimated $2,500. Roofs and window glass were considerably damaged, but aggregate amount of property damage not reported.

On the 8th between 5:40 p. m. and 5:48 p. m. (C. W. T.), heavy hail fell at Advance, resulting in considerable damage. Wheat was damaged about 30%. The storm came from the north, and the path was approximately 30 miles long and 17 miles wide. Stones were one-half inch in diameter. Amount of damage not reported.

On the 9th at about 6:00 a. m. (C. W. T.), heavy hail fell at Nevada and in southern Vernon County, resulting in considerable damage to greenhouses, window panes, roofs, and vegetable and flower gardens. Fruit was knocked from trees. The storm came from the west; path was 20 miles long and 20 miles wide. Amount of damage not reported.

On the 29-30th, between 11:30 p. m. and 1:00 a. m. (C. W. T.), heavy hail fell west of Edina, with considerable damage to corn and gardens. Nearly every window light in some homes were broken. The hailstones were reported as of unusual size. Amount of crop or property damage not reported.

ERRATA

March 1945, page 18: Greatest 24-hour precipitation, and date, at Advance should be 2.32 on 18-19th. Number of days precipitation of .01 inch or more at Bethany should be 8. Mean temperature and date of greatest precipitation at Birch Tree should be 54.2" and 30th, respectively. Date of greatest precipitation at Canton should be 20th. Date of minimum temperature at Lamar should be 7†. Days clear and cloudy at Lockwood should be 16 and 5, respectively. Date of maximum temperature at Marshall should be 16†. Page 20: Precipiation on 19th at Bethany should be *. Page 21: Precipitation on 6th and 7th at Jefferson Barracks should be * and 1.57, respectively. Precipitation on 1st at Macedonia Lookout should be *. Precipitation on 25th and 26th at Steelville should be * and 1.96, respectively.

May 1945, page 37: Precipitation on 28th at Waverly should be .52; total should be 3.52.

H. F. WAHLGREN
ST. LOUIS, MO.

VOL. XLVIV JULY 1945 No. 7

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

The month of July was both drier and cooler than normal in each of the three divisions of the State, and for the State, as a whole. It was the first month since January with a deficient precipitation average and the third consecutive month with average temperature below normal; also, it was the most favorable month for agricultural activities, including crop growth and development, of the 1945 growing season to date.

As a rule, the first three weeks of July were relatively cool, while the last week, or ten days, were generally warmer than normal. Highest maxima occurred generally on the 23d or 24th, when afternoon readings ranged from the high 90's to slightly above 100°, at most stations. Some heat prostration cases were reported. The lowest minimum temperatures ranged from the middle 40's to the middle 50's, at most stations, on various dates during the first half of the month. There were no unusual extremes of temperature reported anywhere in the State. Nights, as a rule, were cool and pleasant and only from the 22d to 25th, inclusive, were they uncomfortably warm. Average temperatures for each of the three divisions of the State, with departures, were as follows: Northern, 74.3°, −2.5°; Southwestern, 75.2°, −2.6°; Southeastern, 75.9°, −2.2°; for the State, 75.1°, −2.9°.

Precipitation which had occurred in unprecedented amounts, and with monotonous frequency, during the preceding five months, ended rather abruptly about the middle of July, and by about the third week rain was needed rather generally over most of the State. However, most sections of the State received beneficial showers during the last week, relieving a dry condition that was rapidly becoming serious in some sections, particularly in the northeastern quarter of the State, where the dry conditions continued at the close of the month. Distribution of the month's precipitation was very irregular, ranging from 8.72 inches in the extreme southwestern corner of the State to only 0.15 inch in the extreme northeastern corner. The Southwestern Division received the most rain during the month, with an average of 2.50 inches, or 1.09 inches less than normal. The average for the Northern Division was 1.87 inches, or 1.76 inches less than normal; for the Southeastern Division the average was 1.92 inches, or 1.48 inches less than normal.

Only minor floods occurred in a few of the larger rivers of the State, during the early part of July, after which streams were well within their banks and receding, generally.

Only one small tornado, three damaging local windstorms, and one occurrence of heavy hail were reported during July.

With a let-up in the unprecedented rainfall which prevailed from February to June, inclusive, rapid progress was made in plowing and planting of field crops during July. All growing crops made good to excellent growth during the first half of the month, but began to deteriorate the latter half, in some areas, because of hot, dry weather. Corn was in various stages of development, with some early-planted tasseling and in roasting ear stage, while the bulk of the crop was late and still being cultivated at the close of the month. Hay making progressed nicely, with only a few interruptions, and a large crop of fine

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. ^{4} Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Pineview Lookout is Duke; Sugar Camp Lookout is Cassville; Wilderness Lookout is Lampe.

Continued from page 49

quality hay was saved. Harvest of small grains was completed and threshing and combining were progressing throughout the latter half of the month. Yields were considerably less than normal, as a rule. A larger than normal crop of soybeans was planted, as much ground that had been intended for corn was planted to that crop because of the lateness of the season. Cotton, in the southeastern counties, made good progress during the month and was blooming during the latter half. A fine crop of early peaches was harvested during the two weeks of the month. Gardens and truck were late, as a rule, but made good growth and development, although needing rain in most sections of the State, at the close of July. Pastures remained green, were in good condition and able to sustain livestock throughout the month in most areas, but were generally needing rain the last week or ten days. In the event of killing frost by the normal date, or earlier, much of the corn crop would be damaged, and farmers were being urged to construct silos, either permanent or temporary, to save as much of the crop as possible.—M. R. W.

TEMPERATURE

The monthly mean for the State, 96 stations reporting, was 75.1°, or 2.9° cooler than the 58-year July average. The highest monthly mean was 78.9° at Malden, and the lowest was 71.8° at Black (near). The highest reported was 105° at Doniphan and Malden, on the 24th, and the lowest was 44° at Black (near), on the 17th.

PRECIPITATION

The average for the State, 214 stations reporting, was 2.10 inches, or 1.44 inches less than the 58-year July average. The greatest monthly amount was 8.72 inches at Anderson, and the least was 0.15 inch at Kahoka. The greatest amount reported in 24 hours was 4.26 inches, at Anderson, on the 26-27th. The average number of days with 0.01 inch, or more, was 6.

MISCELLANEOUS PHENOMENA

Eclipse.—Solar, partial on 9th.

Floods.—In Grand River, at Brunswick, 1st to 4th; also 8th. In Missouri River, at Waverly and below, 1st to 5th. In Mississippi River, in reach Hannibal to Dam No. 25, 1st to 10th; at Louisiana, 14th to 19th and on 27th. In Osage River, at Lakeside, 8th to 14th; 16th to 20th. In St. Francis River, at Fisk, continued from June into August.

Fogs.—Heavy, 2d, 9th, 14th, 23d, 28th, 31st.

Hail.—Light, on 5th at Advance; 8th at Cook Station; 13th at Lawson. Heavy, on 7th. (See special hailstorm notes).

Tornado.—7th. (See special tornado notes).

Windstorms.—8th, 25th. (See special windstorm notes).

HAILSTORM

Heavy hail fell both northwest and east of Jerico Springs, in connection with a local tornado on the 7th at 5:30 p. m. (C. W. T.). Path of the hailstorm was ¼ to 2½ miles wide and 15 miles long; storm moved from the northwest. Stones were described as small to medium, with damage to corn, wheat, oats, hay, gardens, fruit, trees, and roofs estimated at "thousands of dollars".

TORNADO

A small local tornado struck Jerico Springs, Cedar County, at 5:30 p. m., (C. W. T.) on the 7th, resulting in property damage estimated at $50,000 and crop damage estimated at $40,000. The storm was accompanied by heavy hail, which did not fall in the town proper, but fell both northwest and east of Jerico Springs. The tornado came from the northwest, and covered a path ¼ to 2½ miles wide and 15 miles long. Two funnel-shaped clouds were reported. Two persons were drowned in a rain-swollen stream, as a result of the heavy rain which accompanied this storm.

WINDSTORMS

At 3:30 p. m., (C. W. T.) on the 8th, a damaging windstorm struck Eldon, resulting in heavy damage to trees and relatively light property and crop damage. The storm came from the northwest, and covered a path about one mile wide and four miles long. Power and telephone service was disrupted and roofs of some buildings, including the Eldon High School, were blown off or damaged. Amount of damage not reported.

Observations taken at 8:00 a. m. except at 7:30 a. m. at Lakeside. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

(Continued from page 51)

On the same day at 5 p. m., (C. W. T.) a windstorm struck east of Rolla, resulting in damage to trees, roofs of small buildings, and crops. Property damage was not reported, but loss to grain and hay crops was estimated at $2,000. This storm also came from the northwest; the path was one-half mile wide and five miles long.

On the 25th at 1:45 p. m., (C. W. T.) a windstorm struck at Weingarten, resulting in property damage estimated at $500 and crop damage estimated at $200. This storm came from the west, the path being one-half mile wide and ten miles long. Roofs of some buildings were blown off and corn was damaged.

ERRATA

June 1945, page 41: Relative humidity at 6:30 a. m., at Springfield should be 91. Page 42: Total precipitation at Advance should be 15.93. Mean temperature and departure at Lexington should be 69.7 and —3.2, respectively. Date of maximum temperature at Eldon, Mountain Grove, Seligman, and Warsaw should be 27†, 27†, 27†, and 27, respectively. Date of minimum temperature at Lexington should be 4. Mean temperature and greatest 24-hour precipitation at Fort Leonard Wood should be 69.6 and 2.51, respectively. Page 43: Greatest 24-hour precipitation and date at West Plains should be 2.18 on 8–9th. Page 45: Precipitation on 30th at Advance should be .68; total should be 15.93. Page 47: Maximum temperature on 2d and 30th at Lexington should be 62 and 85, respectively; mean maximum should be 69.7. Minimum temperature at Lexington on 3d should be 52: mean minimum should be 61.2.

VOL. XLVIV AUGUST 1945 No. 8

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

August was a decidedly dry month, over most of the State, and in the drier areas crops deteriorated and water supplies became short during the latter half of the month. It was the driest August, for the State as a whole, since 1937 and the tenth-driest month of its name in the past 58 years. This is in marked contrast to the same month a year ago which was decidedly wet, with an average of 6.09 inches, compared to only 2.08 inches for the current month.

The precipitation during the month was spotted and very irregularly distributed, ranging from a total of 8.27 inches at the station reporting the largest monthly amount to only 0.26 inch at the station receiving the least rain. Several stations had showers on as many as 6 to 9 days during the month, while at several others precipitation occurred on only 1 or 2 days. The bulk of the month's rainfall occurred during the first half, the latter half being quite dry over the whole State, and very dry the last week or ten days. The Southeastern Division received the most precipitation, with an average of 2.45 inches, or 1.32 inches less than the 58-year August normal. The Northern Division received the least rainfall, with an average of 1.85 inches, or 1.91 inches less than normal. The average for the Southwestern Division was 1.93 inches, or 2.00 inches less than normal for that section of the State. Heavy local showers of three to more than four inches in a 24-hour period, occurred on the 3d, 5-6th, and 14th.

Temperatures, as a rule, were moderate for August, with no unusual extremes reported. The extreme high of 103°, recorded at one station in each of the three divisions of the State, was the lowest August maximum since 1933, and the extreme low reading of 45°, at one station, was the highest minimum for August since 1941. Maximum temperatures of 100°, or higher, occurred on an average of only one day during the month, while the average number of days with maximum of 90°, or higher, was 16. Warm periods were 1st to 3d, 18th to 21st, and 27th to 31st, with cool periods from the 7th to 10th, and 22d to 26th. The 24th was generally the coolest day, except in the Southeastern Division where the 26th and 27th were the coolest days. The 1st, 2d, 22d, and 30th, were the warmest days, as a rule.

Rivers of the State were well within their banks and generally receding during the month. No flood stages were reached, except locally at Fisk, on the St. Francis River, during the first part of the month, and at Louisiana, on the Mississippi River, where flood stage or above occurred from the 12th to 16th and again from the 21st to 24th.

There were no severe storms during the month, but a few minor local wind and hail storms were reported.

Most crops made good growth and development during the first half of August, but during the latter half, and especially during the last ten days, hot dry weather proved unfavorable and all growing crops were damaged to some extent. However, in the Southeastern Division the dry weather was not so pronounced and crops in that section were, as a rule, in better condition than over the remainder of the State. Threshing of small grains was completed in the northern half of the State,

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period: for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing: for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Pineview Lookout is Duke; Sugar Camp Lookout is Cassville; Wilderness Lookout is Lampe.

Continued from page 57

and harvesting of a fine crop of good quality lespedeza hay progressed throughout most of month. Corn grew well and the early planted was far enough advanced to be safe from frost, but the bulk of the crop was quite late and an unusually lata occurrence of killing frost will be necessary for much of the crop to escape damage. Pastures held up well and were above average condition for August, but deteriorated rapidly the latter part of the month, especially in the drier areas. Cotton made good growth and was fruiting heavily the latter half of the month, with prospects of an excellent crop although it was late, as a rule. Soybeans also made good advance until the last ten days, when they were in need of more rain generally. Much of the soybean crop was also late and probably would be cut for hay as time was getting short for it to make a good crop of beans. Some fall plowing was accomplished the first half of August, but as a rule the ground was too dry and hard the latter half for this work. A large crop of fine quality late peaches was picked and marketed during the month. All gardens, truck, field crops and pastures were in need of a general soaking rain at the close of August.—M. R. W.

TEMPERATURE

The monthly mean for the State, 97 stations reporting, was 76.8°, or 0.2° warmer than the 58-year August average. The highest monthly mean was 79.7° at Kansas City Airport, and the lowest was 74.0° at Louisiana and near Black. The highest reported was 103° at Memphis on the 1st, Doniphan on the 2d and 13th, and at Sweet Springs on the 5th; the lowest was 45° near Black, on the 27th.

PRECIPITATION

The average for the State, 213 stations reporting, was 2.08 inches, or 1.74 inches less than the 58-year August average. The greatest monthly amount was 8.27 inches at Cape Girardeau, and the least was 0.26 inch at Kansas City Airport. The greatest amount reported in 24 hours was 4.70 inches, at Tarkio, on the 3d. The average number of days with 0.01 inch, or more, was 5.

MISCELLANEOUS PHENOMENA

Aurora.—27th, 28th.

Floods.—In Mississippi River, at Louisiana, on 12th, 16th, 21st to 24th. In St. Francis River, at Fisk, continued from July to sometime prior to August 18th (exact date unknown).

Fogs.—Heavy, 5th, 6th, 11th, 12th, 13th, 17th, 21st.

Hail.—Light, on 11th at Fayette; 17th at Browning, Chillicothe, Swan Tower Lookout, Birch Tree, High Lookout; 18th at St. Charles, Kirkwood; 29th at Tarkio. Moderate, on 11th at Clifton Hill. Heavy, 17th at Cuba, 22d south and southwest of Maryville. (See special hailstorm notes).

Windstorms.—5th, 11th, 17th, 22d. (See special windstorm notes).

HAILSTORMS

Moderate hail fell at Clifton Hill, and vicinity, about noon (C. W. T.) on the 11th, resulting in crop damage estimated at $500. The storm was accompanied by a windstorm that did damage estimated at $600 to $700. The storm came from the northeast and covered a path three miles wide and twelve to fourteen miles long. Largest stones were the size of hen eggs.

At about 6:30 p. m., (C. W. T.) of the 20th, heavy hail fell at Cuba, causing crop damage estimated at $1,000, and some damage to roofs. This storm came from the north and its path was one mile wide and three miles long. Stones ranged up to five-eighths inch in diameter. Where the stones piled up they remained on the ground for 24 hours.

During the late afternoon of the 22d, heavy hail fell over a path six miles wide and eight miles long, extending from northeast of Graham nearly to Maryville, in Nodaway County. The storm came from the southwest, with heavy hail in center of the path over an area about one mile wide, and very light hail on the edges of the path. Stones ranged up to three-fourths inch in diameter. Severe crop damage occurred and was estimated at $100,000. The hail was accompanied by wind, which caused additional minor damage.

WINDSTORMS

On the 5th at 6:45 p. m., (C. W. T.) strong winds at Butler did some damage to roofs, but the amount thereof was not reported. This windstorm came from the southwest; length and

Observations taken at 8:00 a. m. except at 7:30 a. m. at Lakeside. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

(Continued from page 59)

width of path are unknown.

About noon (C. W. T.) of the 11th, high winds accompanying a moderate hailstorm struck Clifton Hill, and vicinity, and property damage estimated at $600 to $700 resulted. This storm came from the northeast and covered a path about 3 miles wide and 12 to 14 miles long. Hail damage to crops was estimated at $500.

On the 17th, from 9:40 p. m. to 10:15 p. m., (C. W. T.) high winds, estimated at 50 M. P. H., struck Browning, and vicinity, with considerable damage to trees, hayricks and stacks, and corn; also some damage was done to buildings located 10 miles east of Browning. The winds shifted from the east, to northeast, then to north, although they were reported as straight-line winds. The storm movement was from the northwest, with path about 10 to 12 miles in length and of unknown width. Amount of damage was not reported.

During the late afternoon of the 22d, a windstorm, accompanied by heavy hail, struck the vicinity of Graham and extended nearly to Maryville, in Nodaway County, resulting in minor damage to small outbuildings, trees, gates, and wires. The storm came from the southwest and the path was six miles wide and eight miles long. Damage from wind was relatively light, but hail damage to crops was estimated at $100,000.

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

The outstanding characteristic of the month was the unprecedented frequency of rainfall and the amount thereof, which averaged more than in any previous September since State-wide records began in 1888. The previous wettest September of record was 1926, with an average of 8.64 inches, as compared to 9.46 inches for the current month. Distribution of the month's rainfall was very irregular, monthly totals ranging from 18.36 inches at Buffalo, in the southwestern portion of the State, to only 3.59 inches at Tarkio, in the extreme northwestern corner. Precipitation averages and departures from normal, by divisions, were as follows: Northern 8.83, +4.61; Southwestern 10.07, +5.74; Southeastern 9.49, +5.81. The first week of the month was rather dry, as a rule, but rains set in on the 7th and occurred at frequent intervals throughout the remainder of the month, particularly the last ten days when rain fell almost daily. Despite the record-breaking September precipitation and the unusual frequency of the rain there were no overflows in the major streams of the State, except locally in the Meramec River at Pacific and in the Mississippi River at Louisiana.

Temperatures averaged practically normal during September and no unusual extremes occurred. There was no frost reported anywhere in the State during the month. The first nine days and from the 22d to 28th were generally warmer than normal, with cool periods from the 10th to 18th and the last two days of the month. The 1st, 4th, 5th, and 9th were generally the warmest days, while the 14th, 15th, 29th, and 30th were the coolest days of the month. Maxima of 100°, or slightly above, occurred at several stations in the Southwestern Division on the afternoon of the 4th and 5th, but there were no occurrences of 100° heat over the Southeastern Division, and at only one station, on two days, in the Northern Division. Sunshine for September averaged approximately 10% deficient, for the State as a whole.

The month was free from destructive storms, although a few local occurrences of light hail, without damage, were reported on three days. A rather strong earthquake shock was felt at Caruthersville, and vicinity, on the 23d.

Unusually wet weather the last three weeks of September was unfavorable for maturing of corn and soybeans and for late hay harvest. However, pastures and early sown rye and wheat, for fall pasture, benefitted materially, and dwindling water supplies were adequately replenished by the frequent and heavy rainfall. Some fall plowing was accomplished during the first half of the month, but the frequent rains and wet fields, particularly the last ten days, delayed this work quite generally. It was estimated about 60% to 65% of the corn crop would mature enough to escape frost damage. Cotton in the southeastern counties continued to make good progress during the month, with some bolls opening the last week, but there had been no ginning at the close of the month. Warm, dry weather was badly needed as September closed for the maturing of late crops of corn, soybeans, and cotton.—M. R. W.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ª, ᵇ, ᶜ, etc., number of days missing; for example, ᵇ, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Pineview Lookout is Duke; Sugar Camp Lookout is Cassville; Wilderness Lookout is Lampe.

Continued from page 65

TEMPERATURE

The monthly mean for the State, 95 stations reporting, was 69.4°, or 0.1° warmer than the 58-year September average. The highest monthly mean was 72.8° at Campbell and Sikeston, and the lowest was 65.0° at Unionville. The highest reported was 103° at Clinton on the 4th, and the lowest was 36° at Grant City on the 29th.

PRECIPITATION

The average for the State, 212 stations reporting, was 9.46 inches, or 5.38 inches more than the 58-year September average. The greatest monthly amount was 18.36 inches at Buffalo, and the least was 3.59 inches at Tarkio. The greatest amount reported in 24 hours was 6.76 inches, at Bloomfield, on the 24-25th. The average number of days with 0.01 inch, or more, was 14. There was no snowfall anywhere in the State.

MISCELLANEOUS PHENOMENA

Earthquake.—On 23d; rather strong shock felt at Caruthersville and vicinity.

Floods.—In Meramec River, at Pacific, on 28th. In Mississippi River, at Louisiana, on 7-12th, 23d, 25-26th, 29-30th.

Fogs.—Heavy, 9th, 15th, 18th, 21st, 25th, 26th, 27th, 28th, 30th.

Hail.—Light, 9th at Maryville; 21st at Amity, Auxvasse, near Columbia, Maryville, Sedalia, Warrenton; 26th at Kansas City University.

Windstorms.—No damaging windstorms reported.

ERRATA

July 1945, page 49: Relative humidity for St. Louis Airport at 12:30 a. m., should be 77. Page 51: Mean temperature and departure at St. Louis Airport should be 76.0 and −1.8, respectively.

August 1945, page 58: Mean temperature and departure at Springfield should be 76.6 and +1.6, respectively. Page 61: Precipitation on 12th at Owensville should be blank; total should 2.92. Page 63: Maximum temperature on 26th at Springfield should be 88; mean maximum and mean minimum should be 87.6 and 65.5, respectively.

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Wind-shield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. ‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for September 1945

Vol. XLVIV October 1945 No. 10

Price: 5 Cents a Copy; 25 Cents a Year

GENERAL SUMMARY

October was a very pleasant month, with typical Indian-summer weather prevailing, especially during the latter half. Also, it was a fairly favorable month for the maturing of late planted crops and for the preparation of soil and seeding the winter crop of small grains.

Temperatures were moderate, as a rule, averaging slightly less than 1° below normal for each of the three divisions and for the State, as a whole. There were no unusual extremes of temperature anywhere in the State, although the State maximum of 85° was the lowest maximum of record in the 58 years State-wide records have been kept. A cool spell on the 9-10th resulted in the first frost of the season, which was killing in some sections, especially in the Northern Division. The frost was mostly light to moderate in the southern portions of the State. Subsequent occurrences of frost on several days during the remainder of the month were damaging in varying degree, depending on exposure and location, but many stations, particularly in the southern half of the State, had not recorded killing frosts by the close of the month.

Precipitation generally was adequate and frequent enough for current needs during the month, although averaging three-quarters of an inch below the normal for October. Distribution was rather irregular, ranging from very light in the extreme northwestern corner of the State to rather heavy locally in a few counties in the extreme southern and south-central sections. All of the month's precipitation occurred in the form of rain, no snow being reported anywhere in the State. The average for the Northern Division was 1.19 inches, or 1.45 inches less than normal, while the average for the Southwestern and Southeastern Divisions was 2.53 inches and 2.83 inches, respectively, or 0.61 inch and 0.20 inch less than the respective normals for those divisions.

Streams were generally at relatively low stages throughout the month and no serious overflows occurred.

There were no damaging or destructive storms of any kind. Sunshine averaged approximately normal, for the month.

The mild open weather was very favorable for livestock on range and the fine fall growth of pastures and early sown small grains, due to an excessively wet September, provided an abundance of early fall grazing. Corn and other late planted crops matured quite well during the month, but the frosts of the 9th and 10th, and later in the month, damaged considerable corn and soybeans, which had been planted unusually late, due to an unprecedented wet spring. Cotton picking and ginning progressed rather slowly the first half of the month, but made better advance during the latter half. Corn husking and cribbing began and was continuing at the close of the month, with reports of considerable soft corn in late planted fields. Yields were also below those of last year, as a rule, but above the 10-year average. Excellent progress was made in the seeding of winter wheat during the month and this work was mostly completed. The ground was in very good condition for making a good seed bed. Many wheat fields were green and growing nicely at the close of the month; stands were very good.—M. R. W.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{o}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Pineview Lookout is Duke; Sugar Camp Lookout is Cassville; Wilderness Lookout is Lampe.

Continued from page 73

TEMPERATURE

The monthly mean for the State, 93 stations reporting, was 56.8°, or 0.9° cooler than the 58-year October average. The highest monthly mean was 60.5° at Joplin, and the lowest was 52.8° at Tarkio. The highest reported was 85° at Nevada, Doniphan, and Greenville on the 12th, Tarkio and Marshall on the 18th, Marshall on the 19th, and Seligman on the 20th; the lowest was 23° at Tarkio on the 22d.

PRECIPITATION

The average for the State, 210 stations reporting, was 2.18 inches, or 0.76 inch less than the 58-year October average. The greatest monthly amount was 7.08 inches at Fredericktown, and the least was 0.18 inch at Tarkio. The greatest amount reported in 24 hours was 6.20 inches, at Fredericktown, on the 21st. The average number of days with 0.01 inch, or more, was 6. There was no snowfall reported anywhere in the State.

MISCELLANEOUS PHENOMENA

Aurora.—27th.

Floods.—In the Osage River, at Lakeside, flood stage was reached on the 8th. In the Mississippi River, at Louisiana, flood stage or slightly higher occurred from the 2d to 4th, 6th to 7th, and 9th to 11th.

Fogs.—Heavy, 1st, 3d, 4th, 5th, 6th, 7th, 9th, 12th, 15th, 16th, 21st, 24th, 25th, 30th.

Frosts.—Light, 9th, 10th, 11th, 13th, 15th, 16th, 17th, 20th, 22d, 23d, 24th, 25th, 26th, 27th, 29th, 31st. Heavy, 9th, 10th, 15th, 20th, 25th. Killing, 9th, 10th, 15th, 22d, 23d, 25th, 26th.

Hail.—Light, 18th at Brunswick; 19th at St. Charles.

Windstorms.—No damaging winds reported.

DAMAGE BY LIGHTNING

During an early morning thunderstorm on October 18th, lightning struck the Missouri Farmers' Association mill building at Columbia, resulting in a total loss of the building and contents, estimated at more than $100,000.

OBITUARY

Mr. John H. Patterson, Cooperative Observer at Harrisonville, Mo., died on his eighty-second birthday, Oct. 12, 1945. Mr. Patterson's services began on Sept. 1st, 1919, and he served faithfully and continuously until his death. The Weather Bureau and the community in which he served is deeply indebted to this public servant for his valuable contribution to the climatic history of Harrisonville.

VOL. XLVIV NOVEMBER 1945 No. 11

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

The month of November was both warmer and drier than normal and the mild open weather was favorable for most seasonal outdoor activities and for livestock on range.

Temperatures were moderate, as a rule, with no unusual extremes being reported. Maxima in the high 70's and lower to middle 80's were quite general on the 1st, 6th, 7th, and 8th, while the lowest temperatures, ranging from a low of 6° to as high as the low 20's, occurred between the 22d and 24th, at most stations. There were no zero temperatures recorded anywhere in the State during the month. The Southeastern Division had the highest monthly average of 48.0°, or 2.1° warmer than normal and the Northern Division had the lowest with 43.2°, or 0.9° warmer than normal. The average for the Southwestern Division was 47.7°, +1.8°. The 1945 growing season, at stations which did not have a killing frost in October, was brought to a close at most stations on the 4th; however a few stations did not have a killing frost until the 9th, 14th, 15th, or 22d. There was an average of 15 days with minimum temperature 32°, or lower, during the month.

Precipitation was mostly in the form of rain during November and averaged considerably below normal in all three divisions, particularly in the Northern and Southwestern Divisions, where the monthly averages were only 0.95 and 0.70 inch, respectively. The Southeastern Division received an average of 2.52 inches during the month, with several stations in that division reporting monthly totals of 4 or 5 inches. The driest area was in the southwestern counties of the State, where monthly totals were generally less than one-half inch and locally in Jasper and McDonald counties less than one-quarter inch. The extreme southeastern group of counties was the wettest area during the month. The first snowfall of the season fell on the 20th-21st, but was mostly light to moderate. Measurable snowfall was confined to the northern third of the State, as a rule, and amounts were less than two inches at most stations, except in Putnam, Sullivan, and Adair counties, where amounts of three to four inches fell. The snow quickly melted and the ground was not covered for more than three or four days anywhere, although drifts remained unmelted for several days at some stations.

River stages were generally at low levels during the month and there were no overflows in any of the major streams of the State.

Sunshine averaged slightly more than normal for November.

There were only two damaging windstorms reported during the month although high winds were prevalent on several days. Light hail fell at several stations on various dates.

Good progress was made in gathering the corn crop. Cotton picking was interrupted by frequent precipitation in the southeastern counties and yields were very disappointing, being the poorest in several years. The good progress made by the fall wheat crop during October was retarded somewhat during November by dry weather, particularly in the Northern and Southwestern Divisions of the State and more moisture was needed at the close of the month in those divisions. The acre-

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Wilderness Lookout is Lampe.

Continued from page 81

age sown to wheat this fall was reported by the Bureau of Agricultural Economics as slightly more than last year, but considerably less than the average of the past ten years, in this State. Livestock continued in good condition, generally, but considerable dry feeding was necessary as condition of pastures and ranges declined due to dry weather and the approach of winter.—M. R. W.

TEMPERATURE

The monthly mean for the State, 96 stations reporting, was 46.3°, or 1.8° warmer than the 58-year November average. The highest monthly mean was 52.5° at Campbell, and the lowest was 39.2° at Unionville. The highest reported was 86° at Marshall on the 6th, and the lowest was 6° at Maryville on the 22d.

PRECIPITATION

The average for the State, 212 stations reporting, was 1.39 inches, or 1.26 inches less than the 58-year November average. The greatest monthly amount was 5.15 inches at Campbell, and the least was 0.20 inch at Joplin. The greatest amount reported in 24 hours was 2.80 inches, at Jackson, on the 9th. The average number of days with 0.01 inch, or more, was 5.

Snowfall averaged 0.2 inch, or 0.8 inch less than the 56-year November average. The greatest monthly snowfall was 4.0 inches at Lucerne.

MISCELLANEOUS PHENOMENA

Earthquake.—On 13th; felt at Perryville and Cairo, Ill; strong shocks reported at Cairo.

Fogs.—Heavy, 8th, 9th, 11th, 12th, 13th, 17th, 18th, 19th, 20th, 25th, 26th, 27th, 28th, 29th, 30th.

Frosts.—Killing, (where killing had not occurred previously), 3d, 4th, 9th, 14th, 15th, 22d.

Hail.—Light, 6th at Saverton; 17th at Hannibal, Kansas City Airport, Mexico, Shelbina; 20th at Belleview, East End, Farmington, St. Louis City, St. Louis Airport, Webster Groves; 21st at Crane Mountain, Seymour; 26th at Advance, Elijah, and near Steele; 27th at Jackson.

Sleet.—2d, 10th, 21st.

Windstorms.—8th, 26th. (See special windstorm notes).

WINDSTORMS

On the 8th high wind caused only minor damage at Browning.

On the 26th, at 11 p. m., a destructive wind and electrical storm struck the vicinity of Steele, Pemiscot County, resulting in the death of two persons, injury to eight others, and property damage estimated at 10 to 15 thousand dollars. The storm came from the north or northwest over a path, of greatest destruction, one mile wide and about three miles long. Heavy rain and some hail accompanied the storm. High winds were reported over the county, but without damage outside the storm path mentioned above.

OBITUARIES

Mr. John G. Putz, cooperative observer at the Jackson station died in October, but the exact date of his death is not known at this time. Mr. Putz served as cooperative observer from June 1, 1920 to April 1, 1939 and from October 8, 1941 until about October 7, 1945.

Mr. P. J. Sargeant, engineer for the Empire District Electric Co., of Joplin, died suddenly on October 21. Although the Empire Co., was listed as the official observer in publications of the Missouri Climatological Data, Mr. Sargeant was the supervisory official responsible for weather reports received from the Joplin station. Mr. Sargeant's cooperative services began in May 1923 and continued until his death.

Mr. Frank Hall, former cooperative observer at Steffenville, died on November 5, 1945, at the age of 95 years. Mr. Hall's service began in May 1903 and ended April 30, 1942, when infirmities and failing eyesight forced him to give up his cooperative duties. At the time of his retirement he was one of the oldest cooperative observers, in point of service, having served continuously for 39 years.

Mr. C. D. Wilson, cooperative observer at the Unionville station from January 1942 until June 30, 1945, died on November 16. Because of ill health Mr. Wilson was forced to relinquish his services in favor of his wife, Mrs. Dora B. Wilson, the present observer at Unionville.

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Windshield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. ‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for November 1945

(See precipitation data in daily precipitation table)

Observations taken at 8:00 a. m. except at 7:30 a. m. at Lakeside. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

(Continued from page 83)

It is very unusual, and in all probability without precedent, that so many of our faithful and loyal co-workers should pass on in such a short period of time. The Weather Bureau and the communities served by these public servants have suffered an irreparable loss and owe much to them for the public service they have performed during their tenure as cooperative observers. Although they have passed in death, memories of them will live forever through the climatic records which they compiled for their respective communities and which were subsequently published and preserved for the benefit of this and future generations.

ERRATA

May 1945, page 34: Mean temperature and departure at Macon should be 57.6 and −5.9, respectively. Page 39: Minimum temperature on 11th at Macon should be 38; mean minimum should be 47.4.

October 1945, page 73: Degree days at Springfield should be 267. Page 74: Greatest precipitation in 24 hours at Columbia should be 0.63 on Sept. 30th-Oct 1st.

Daily Temperatures for November 1945

GENERAL SUMMARY

December was a cold, damp, cloudy month with unprecedentedly heavy snowfall. It was generally unfavorable for most outdoor work and for livestock, the ground being snow-covered much of the time after the 12-13th, particularly over the northern half of the State.

It was the coldest December since 1924 and the fifth-coldest of record in the 58 years State-wide records have been kept. Although there were no unusual extremes reported, temperatures were generally below normal throughout most of the month, with a prolonged cold period from the 10th to the 23d, inclusive. The 19th and 20th were the coldest days, as a rule, while the 7th and 8th were the warmest days of the month. Minimum temperatures of 32°, or lower, occurred on an average of 28 days during the month, while zero or lower, occurred on an average of 2 days, for the State as a whole. All divisions of the State averaged from approximately 5° to 7° below their respective normals and each individual station reported a monthly average well below normal, indicating the prevailing low temperatures were general over the entire State.

Precipitation averaged 0.78 inch less than normal for December and was irregularly distributed, occurring as rain, snow, and sleet, at frequent intervals. A rather general occurrence of rain, freezing as it fell, prevailed on the 23d-24th over much of the State, resulting in the formation of glaze which seriously interfered with a heavy holiday traffic. However, there was practically no damage to trees and communications and power lines, as a result of the glaze. The Northern Division received the most precipitation during the month, the average being 1.87 inches, or 0.29 inch in excess of normal. The other two divisions of the State both had monthly averages less than normal, i. e: Southwestern 0.96 inch, —1.09 inches; Southeastern 1.34 inches, −1.55 inches. The average monthly snowfall of 7.9 inches this month was the most ever received in Missouri, during December, in the 56 years that snowfall records are available. Many stations in the northern half of the State received from 10 to 16 inches of snow during December, while smaller amounts fell over the southern half.

There were no damaging storms of any kind reported during the month. River stages receded generally and at the close of December were at relatively low levels.

Due to the prevailing low temperatures and snow covered ground, very little farm work, other than daily chores, was accomplished during the month. The snow-cover provided a protecting blanket for the winter wheat crop, which was generally in good condition at the close of December. Some corn was still in the fields. Heavy feeding of livestock was necessary, as pastures and ranges were covered with snow the greater part of the month, especially over the northern half of the State. Large quantities of fuel were also consumed as a result of the prolonged cold weather.—M. R. W.

TEMPERATURE

The monthly mean for the State, 99 stations reporting, was 27.8°, or 6.3° colder than the 58-year December average. The highest monthly mean was 36.1° at Caruthersville, and the lowest was 19.8° at Tarkio. The highest reported was 70° at Ozark Beach on the 8th, and the lowest was 20° below zero at Tarkio on the 19th.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Wilderness Lookout is Lampe.

Continued from page 89

PRECIPITATION

The average for the State, 216 stations reporting, was 1.39 inches, or 0.78 inch less than the 58-year December average. The greatest monthly amount was 3.57 inches at Memphis, and the least was 0.32 inch at Bunker. The greatest amount reported in 24 hours was 1.75 inches, at King City, on the 1st. The average number of days with 0.01 inch, or more, was 8.

Snowfall averaged 7.9 inches, or 4.3 inches more than the 56-year December average. The greatest monthly snowfall was 16.0 inches at Lexington, and the least was 1.9 inches at Ozark Beach.

MISCELLANEOUS PHENOMENA

Eclipse.—Lunar, 18th.

Fogs.—Heavy, 1st, 3d, 6th, 9th, 13th, 14th, 17th, 18th, 21st, 23d, 24th, 25th, 26th, 27th, 28th, 29th, 30th.

Glaze.—12th, 13th, 23d, 24th, 25th, 27th, 30th, 31st.

Hail.—Light, on 1st at University of Kansas City, Lawson, and Butler.

Sleet.—1st, 3d, 10th, 12th, 13th, 19th, 23d, 24th, 25th, 27th, 30th.

Windstorms.—No damaging winds reported.

ERRATA

July 1945, page 51: Greatest 24-hour precipitation and date at Cairo, Ill., should be 0.84 on June 30–July 1.

August 1945, page 62: Monthly evaporation at St. Louis (Washington University) should be 5.437.

September 1945, page 67: Mean temperature and departure at St. Louis (City Office) should be 70.0 and − 0.5, respectively. Page 71: Minimum temperature on 26th at St. Louis should be 63; mean minimum should be 62.3.

November 1945, page 81: Total degree-days at Springfield should be 546.

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Wind-shield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. ‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for December 1945

(See precipitation data in daily precipitation table)

VOL. LIX ANNUAL SUMMARY 1945 No. 13

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

JUL 20 1946
UNIVERSITY OF ILLINOIS

GENERAL SUMMARY

For the third time since the records began 58 years ago, the average precipitation for the State exceeded fifty inches, this year's average being 53.26 inches. Only 1898 and 1927 had greater average annual amounts. The first six months of 1946 were, collectively, the wettest ever experienced in any six-month period, January to June, inclusive. The period average for these months in 1945 was 34.66 inches, compared with the previous record of 31.49 inches set in 1927. By the close of June some stations had received more precipitation than they normally get in a full year. Too, a new record for average number of days with 0.01 inch, or more, of precipitation, in a calendar year, was set, there being 112 such days in 1945; previous record was 106 in 1935. The year, as a whole, was slightly cooler than normal.

March was unusually warm and wet, being the wettest March since records began in 1888. September also set a new high mark for average precipitation, for months of that name, with a State average of 9.46 inches. December was the coldest month of the year, with a mean temperature of 27.8°. The summer, as a whole, was cooler than normal. The wet September proved unfavorable for the maturing of corn and soybeans, and for the harvest of late hay, but the following two months were favorable for farm work, although frost, in some localities, damaged corn and soybeans. Corn yields were below those of 1944, but above the 10-year average production.

Snowfall for the year averaged 19.6 inches, the greatest since 1940. One snowstorm, on February 16-17th, was heavy enough to hamper rail and motor traffic in parts of the counties bordering the Missouri River.

Hail damage for the year exceeded a million dollars, with more than half a million of that amount reported in St. Louis and St. Louis County, on May 14th, when hail fell over an area 8 to 10 miles wide and about 15 miles long.

Tornadoes occurred in April, June and July, 7 persons being killed and 74 injured in the April storms while 5 persons were injured by similar disturbances in June. Two persons were killed in a windstorm occurring in the vicinity of Steele, Pemiscot County, on November 26th, and 8 persons were injured. Details of tornadoes, wind and hail storms will be found in the respective monthly issues of Climatological Data for 1945.

Although flood damage in 1945 was not as heavy as in the two preceding years, it nevertheless aggregated several million dollars. In the Meramec basin, severe flooding occurred in June. At Valley Park the river crested at 33.0 feet at noon, June 11th, the highest reading at that point since 1916. On the afternoon of June 8th a very heavy rain, of so-called cloudburst proportions, fell locally at Newburg, Phelps County, causing a flash flood on the creek running through that section and resulting in the drowning of 5 persons. Property damage was estimated by the U. S. Engineer Office, Kansas City, Mo., at $277,141. No record of actual rainfall at Newburg and immediate vicinity was available, but the amount was no doubt unusually heavy.

* Occurrence of killing frost not recorded; dates given are last in spring and first in autumn of temperature 32° or lower.

(Continued from page 97)

Slight earthquakes, causing no damage, were felt in parts of the State on several dates.

TEMPERATURE

The annual mean temperature for the State was 54.7°, or 0.4° below than the 58-year normal. The highest annual mean was 59.1° at Campbell, and the lowest annual mean was 49.6° at Unionville. The highest temperature recorded was 105° at Doniphan and Malden on July 24th, and the lowest was 20° below zero at Tarkio on December 19th.

PRECIPITATION

The average annual precipitation for the State was 53.26 inches, or 12.82 inches more than the 58-year average. The greatest annual amount was 84.94 inches at Bernie, and the least annual amount was 32.98 inches, at Waverly. The greatest local monthly amount was 18.36 inches at Buffalo in September, and the least local monthly amount was 0.15 inch at Kahoka in July. The greatest amount in 24 hours was 6.98 inches at Sikeston on June 7-8. The average number of days with 0.01 inch, or more, was 112, or 22 more than normal.

The average annual snowfall for the State was 19.6 inches, or 1.7 inches more than the 52-year average. The greatest annual snowfall was 38.5 inches at Palmyra, and the least annual amount was 5.1 inches at New Madrid. The greatest monthly snowfall was 18.7 inches at Canton in January.

ERRATA

May 1945, page 39: Mean maximum temperature at St. Joseph should be 69.0.

July 1945, page 51: Number of cloudy days at West Plains should be 4.

October 1945, page 79: Mean minimum temperature at St. Joseph should be 45.3.

November 1945, page 82: Number of partly cloudy and cloudy days at Springfield should be 6 and 11, respectively.

December 1945, page 90: Mean temperature and departure at St. Joseph should be 24.2 and − 5.4, respectively. Page 95: Mean maximum temperature at St. Joseph should be 31.5.

Monthly and Annual Precipitation for the Year 1945, with Departures from Normal

VOL. L — JANUARY 1946 — No. 1

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

January 1946, was a comparatively wet, mild, and open month with very little snowfall; the ground was bare most of the time. Heavy rains on the 5-6th, and again on the 8-9th, caused rapid rises in most rivers of the State, resulting in overflows in the Black, Grand, St. Francis and portions of the Mississippi and Osage rivers.

It was the warmest January since 1944, and averaged 3.8° warmer than the same month one year ago. Temperature changes were rather sudden and frequent, but no unusual extremes occurred. The 1st, 22d, 26th and 27th were the coldest days, while the 3d, 4th, 5th, 6th, 18th and 30th were the warmest, generally. A decidedly warm period occurred from the 3d to 19th, resulting in an unusually early January thaw, during which time ice in rivers and streams broke up and moved out, the freeze went out of the ground and all snow accumulation from the previous month was melted the first day or two of this warm period. All three divisions of the State averaged from more than 2° to over 3° warmer than normal. Only a few individual stations had sub-normal monthly temperature averages.

Precipitation was mostly in the form of rain during the month and occurred at rather frequent intervals, but the distribution was decidedly irregular. The Southeastern Division received the greatest amount of precipitation, with an average of 3.47 inches, which was 0.22 inch more than normal. The average for the Northern Division was 2.64 inches and for the Southwestern Division it was 3.24 inches, or 1.04 and 1.13 inches, respectively, more than normal. Snowfall was of little consequence during January, except for moderate to rather heavy falls locally in east-central counties on the 11th and 20th, where monthly totals were from 4 to over 7 inches at some stations. The snow melted rather quickly, however, in this area and the ground was not covered for more than three or four days, following the fall on the 20th and for only a day, or even less, following the fall on the 11th.

There were no damaging storms of any kind reported during the month. Sunshine averaged slightly more than normal.

The mild open weather was favorable for seasonal outdoor work, but frequent precipitation, and alternate thawing and freezing, kept fields and dirt roads muddy much of the time. Some corn still remained in the fields at the close of the month. Although there was practically no protective snow cover for the winter wheat crop, it was belived to have come through in good condition. The soil was thoroughly soaked by the rather heavy rains and the general thaw during the warm period from the 3d to 19th, and there was an ample reserve of water supply and of sub-soil moisture, at the end of January. Livestock generally were in good condition, but required dry-feeding throughout most of the month, due to soft and muddy fields and pastures. Auction sales of livestock and farm equipment were numerous in rural areas during the month.—M. R. W.

TEMPERATURE

The monthly mean for the State, 99 stations reporting, was 33.8°, or 2.9° warmer than the 59-year January average. The highest monthly mean was 40.7° at Caruthersville, and the

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Wilderness Lookout is Lampe.

Continued from page 1

lowest was 26.0° at Unionville. The highest reported was 71° at Caruthersville on the 6th, and the lowest was 15° below zero at Tarkio on the 1st.

PRECIPITATION

The average for the State, 198 stations reporting, was 3.12 inches, or 0.80 inch more than the 59-year January average. The greatest monthly amount was 7.37 inches at Caruthersville (river station), and the least was 0.95 inch at Tarkio. The greatest amount reported in 24 hours was 3.79 inches, at Sikeston, on the 8th. The average number of days with 0.01 inch, or more, was 8.

Snowfall averaged 0.8 inch, or 3.6 inches less than the 55-year January average. The greatest monthly snowfall was 7.5 inches at Moselle, while a number of stations reported no snowfall.

MISCELLANEOUS PHENOMENA

Dust.—Light, on 30th.

Floods.—In Black River, at Poplar Bluff, on the 11th. In Grand River, 5th to 12th. In the Mississippi River, in the reach from Keokuk to Grafton, 4th to 20th; on the 22d; in the reach from Chester to below New Madrid, 10th to 26th. In the Osage River, at Lakeside, 13th to 14th and 17th to 18th. In the St. Francis River, at Fisk, 12th to 16th.

Fogs.—Heavy, 1st, 2d, 3d, 4th, 5th, 6th, 8th, 10th, 11th, 12th, 15th, 16th, 19th.

Glaze.—8th, 9th, 11th, 19th, 20th, 21st, 29th, 30th.

Hail.—Light, 4th at Hannibal and Kansas City University; 7th at Caruthersville.

Sleet.—4th, 7th, 8th, 11th, 19th, 20th, 21st, 23d, 24th, 29th, 30th.

Windstorms.—No damaging winds reported, although rather high winds occurred on several days, particularly the 5th, 23d, 25th, and 30th.

ERRATA

May 1945, page 34: Greatest 24-hour precipitation and date at Tarkio should be 2.21 on 13-14th.

December 1945, page 89: Degree days at Springfield should be 1099.

ST. LOUIS, MO.

VOL. L FEBRUARY 1946 No. 2

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

The month was unusually mild for the time of year and was quite favorable for seasonal outdoor work over much of the State, particularly the latter half, except too wet for much field work in the Southeastern Division.

Only three Februaries in the past 59 years have averaged warmer than the current month, namely in 1927, 1930, and 1938. Monthly averages this month ranged from approximately 5° to 8° above normal for the three divisions of the State and each reporting station had above-normal monthly average. The 25th was the warmest day of the month, as a rule, when maximum temperatures in the high 60's to the middle 70's were registered. The 15th was generally the coldest day, when minimum readings ranged from near zero, at a few stations in the Northern Division, to the lower 20's at some southern stations. There were no outstanding or prolonged cold periods, daily temperatures averaging well above normal, as a rule, except for brief periods on the 9th and 10th, 14th and 15th, and again on the 27th, when they were below normal. No unusual extremes of temperature were reported.

Precipitation was very irregularly distributed during the month, being very light in the extreme northern counties, and rather heavy in most of the Southeastern Division. Monthly totals ranged from 0.10 inch at the station receiving the least amount of precipition to 7.33 inches at the station having the greatest monthly amount. The bulk of the month's moisture was from rain, snowfall being rather light and infrequent, except moderate to heavy locally in south-central portions on the 9-10th, and again on the 12-13th in central and east-central portions of the State. The snowfall quickly melted and the ground was not covered for more than four or five days at any station, although drifts remained unmelted for a longer period. The average precipitation for the Northern Division was only 0.97 inch, or 0.62 inch less than normal; for the Southwestern Division it was 2.98 inches, −0.97 inch, and for the Southeastern Division it was 4.48 inches, +1.72 inches.

Following heavy precipitation on the 12-13th, rather marked rises occurred in most rivers of the southern half of the State, resulting in overflows locally in the Black, Bourbeuse, Current, Gasconade, Meramec, Mississippi, and St. Francis rivers.

There were no damaging storms of any kind reported during the month. However, an unusual phenomenon, for so early in the year, occurred on the 5th when a rather general duststorm, borne by high southwesterly winds, passed over the State reducing visibility in some places to less than one mile and locally at Browning to less than one-quarter mile.

The prevailing mild, open weather during February was very favorable for grasses and wheat and these became green and made good growth, particularly the latter part of the month. However, fruit buds were prematurely advanced by the unseasonable warmth which was an unfavorable feature of the month's weather. Some corn was still being husked out of the shock the latter part of the month. Some oats had been sown, locally. Considerable plowing and disking of fields, where they

(Continued on page 11)

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Wilderness Lookout is Lampe.

Continued from page 9

were dried out sufficiently to permit this work, was accomplished during the latter half in preparation for early seeding of oats and planting of other crops. There was no freeze in the ground, generally, at the close of the month and the soil had already settled and was drying out nicely. Livestock continued in good condition and had range of pastures and stalk fields most of the month as a result of the lack of snow cover. Present conditions are indicative of an early spring this year.—M. R. W.

TEMPERATURE

The monthly mean for the State, 98 stations reporting, was 40.8°, or 7.4° warmer than the 59-year February average. The highest monthly mean was 46.4° at Caruthersville, and the lowest was 32.4° at Unionville. The highest reported was 75° at Chillicothe on the 4th, and the lowest was 1° below zero at Canton on the 15th.

PRECIPITATION

The average for the State, 213 stations reporting, was 2.81 inches, or 0.69 inch more than the 59-year February average. The greatest monthly amount was 7.33 inches at Ellsinore Lookout, and the least was 0.10 inch at Lucerne. The greatest amount reported in 24 hours was 3.50 inches at Weingarten, on the 13th. The average number of days with 0.01 inch, or more, was 5.

Snowfall averaged 2.6 inches, or 2.4 inches less than the 55-year February average. The greatest monthly snowfall was 10.0 inches at Van Buren; a number of stations reported no snowfall.

MISCELLANEOUS PHENOMENA

Auroras.—6th, 7th.

Duststorm.—5th.

Floods.—In Black River, at Poplar Bluff, 15th to 17th. In Bourbeuse River, at Union, on 16th. In Current River, at Doniphan, 14th to 15th. In Gasconade River, at Jerome, 15th to 16th. In Meramec River, 14th to 17th. In the Mississippi River, at Louisiana, on 1st and 16th; also, in the reach from Cairo to New Madrid, 14th to 27th. In St. Francis River, at Fisk, 15th to 26th.

Fogs.—Heavy, 4th, 8th, 9th, 13th, 22d, 23d.

Glaze.—12th, 13th, 23d.

Hail.—Light, on 5th at University of Kansas City.

Sleet.—9th, 10th, 12th, 13th, 14th, 18th, 19th, 23d, 26th.

Windstorms.—No damaging winds reported, but rather high winds occurred on several days.

ERRATA

August 1945, page 59: Mean temperature and departure at Poplar Bluff should be 78.2 and + 0.2, respectively. Date of maximum temperature at Sikeston should be 2d.
Page 61: Precipitation on 5th and 6th at Marshall should be blank and .22, respectively.
Page 63: Mean maximum temperature at Poplar Bluff should be 91.0.

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Windshield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. ‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for February 1946

(See precipitation data in daily precipitation table)

ST. LOUIS, MO.

VOL. L — MARCH 1946 — No. 3

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

Unseasonably mild weather, for this time of year, prevailed in Missouri during March and all vegetation and field work was approximately four weeks ahead of normal advancement at the close of the month. It was a very favorable month for all outdoor work and for the growth of wheat, grasses and other crops that had been planted. However, the unseasonable advancement of all fruits and berries caused great concern as to their chances of escaping serious damage or being entirely killed by later frosts or freezing temperatures, which usually occur during the first half of April or even later.

It was the warmest March since 1910 and the second warmest of record in the 59 years that State-wide records have been kept; also, it was the third consecutive month of the current year with average temperature well above normal, the average for the three months being approximately 7° warmer than the normal for the period January to March, inclusive. The unusually mild weather was State-wide, all three divisions of the State averaging from approximately 10° to 12° above their respective normals and not a single reporting station had a subnormal monthly average. There were no freezing temperatures, or frost formation, during the latter half of the month, as a rule, except at a few scattered stations. The 9th and 10th were generally the coldest days, while the 29th and 31st were generally the warmest days of the month. There were no unusual extremes of temperature for the month, as a whole, but the maximum on the 31st was the highest of record, for that date, at a number of stations. No zero temperatures occurred anywhere in the State and the average number of days with minimum 32°, or lower, was only 4.

Precipitation was irregularly distributed during March, averaging approximately one inch more than normal over the Northern Division, and slightly more than one inch below normal over the Southwestern and Southeastern divisions. Showers were rather frequent in the Northern half of the State, several stations in that area reporting rain on 12 to 15 days during March. During February this was the driest section of the State. Practically all of the month's precipitation was from rain, snowfall being of little consequence and the ground was not covered for more than one day, at any place. Measurable snowfall was confined to the extreme Northwestern and extreme Northeastern tier of counties. Most stations in the southern half of the State reported no snowfall.

Minor overflows occurred in portions of the Grand, Meramec, and Mississippi rivers during March. In the reach from Keokuk to Grafton the Mississippi was above flood stage continuously after the 14th.

Fruit trees bloomed heavily during the month and the prospects for a bumper crop of all fruits were exceptionally good at the end of March, barring subsequent damage by frost or freezing temperatures. Most of the oat crop was sown during the month under favorable weather and soil conditions and was coming up to good stands, at the close. Most early gardens and potatoes were planted. Wheat and grass made excellent growth and were in good condition throughout March. Much plowing for corn and soybeans was accomplished during the

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period: for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Wilderness Lookout is Lampe.

Continued from page 17

month, with the ground in fine working condition. However, more moisture was needed at the close, in most of the southern half of the State, to keep the soil in good working condition and to sustain the rapid growth of wheat, pastures, and meadows. Alfalfa was about ready for the first cutting over much of the southern half of the State, as the month closed. The indications for an early spring, prevailing at the close of February, were further enhanced by the very favorable weather during March.—M. R. W.

TEMPERATURE

The monthly mean for the State, 99 stations reporting, was 55.3°, or 11.1° warmer than the 59-year March average. The highest monthly mean was 58.8° at Cape Girardeau and Caruthersville, and the lowest was 50.0° at Unionville. The highest reported was 92° at Anderson, on the 31st, and the lowest was 12° at Kirksville, on the 9th.

PRECIPITATION

The average for the State, 213 stations reporting, was 2.82 inches, or 0.42 inch less than the 59-year March average. The greatest monthly amount was 7.31 inches at Tarkio, and the least was 0.71 inch at Forsyth. The greatest amount reported in 24 hours was 3.10 inches at Birch Tree on the 5-6th. The average number of days with 0.01 inch, or more, was 9.

Snowfall averaged only 0.2 inch, or 2.7 inches less than the 56-year March average. The greatest monthly snowfall was 3.0 inches at Oregon and Trenton.

MISCELLANEOUS PHENOMENA

Auroras.—23d, 24th, 27th, 28th.

Floods.—In Grand River, at Chillicothe, on 7th, 17th to 19th, 25th, 27th; at Gallatin on 18th. In Mississippi River, in the reach from Keokuk to Grafton, on 6th and continued into April; at Cairo on 26th and continued into April. In Meramec River, at Pacific, on 8th.

Fogs.—Heavy, 5th, 6th, 14th, 15th, 19th, 20th, 24th, 25th, 26th, 27th.

Glaze.—8th, 10th.

Hail.—Light, on 4th at Conception, Philadelphia, Marshall; 16th at Auxvasse, Columbia, Conception, Hannibal, Kansas City University, Sikeston; 18th at Edina; 22d at Brunswick, Carthage, Kansas City Airport, Kansas City University, Kirksville, Joplin, Sweet Springs, Warrensburg, Warsaw; 23d at Fayette, Mexico, Shelbina; 26th at Conception. Moderate, on 22d at Cora, Sullivan County; no damage. Heavy, on 22d near Browning; 29th near Graham, Nodaway County. (See special hailstorm notes).

Sleet.—6th, 8th, 9th.

Windstorms.—12th, 15th, 16th, 29th. (See special windstorm notes).

HAILSTORMS

On the 22d, heavy hail fell 3 miles northeast of Browing, for about ten minutes, beginning at 7:15 p. m. At one time the ground was almost white with hailstones, which were about one inch in diameter. The storm moved from the southeast, over a narrow path about 10 miles long. The hail was not heavy over the entire length of the path. At Cora, about 5 miles north of Browning, the hail was reported as moderate. Damage to property was negligible; however a few trees were stripped of their small leaves and buds.

On the 29th, at about 5 p. m., heavy hail, accompanied by high wind and heavy rain, fell in the vicinity of Graham, Nodaway County, to a depth of about one inch. The storm came from the southwest. The width and length of the path, as well as the amount of damage, was not reported.

WINDSTORMS

On the 12th, high southwest wind estimated at 50 m. p. h., occurred near Browning, between 1 and 3 p. m., resulting in minor damage to small outbuildings, hay ricks and a few other objects of small importance.

On the 15th, high wind of 60 m. p. h., occurred between 2:30 and 3 p. m., at Joplin, resulting in thousands of dollars damage to buildings, plate glass windows, power and transmission lines and poles, signs, and trees. One person was slightly injured. The windstorm was reported as local, extending only a short distance out of the city limits to the north and east.

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

(Continued from page 19)

During the night of the 15-16th high winds in Bollinger and Cape Girardeau counties uprooted trees in some places, unroofed some buildings and blew down other smaller and lighter ones. Damage in the vicinity of Marble Hill was estimated at $6,000, with minor damage over a considerable area in Cape Girardeau County. The storm began before midnight of the 15th and lasted for two hours, moving from the SSE. No one was injured and there was no crop damage.

On the 29th, about 5 p. m., high wind, accompanied by heavy rain and hail, struck the Maitland-Graham area of Oregon and Nodaway counties, causing serious damage to barns, small outbuildings, windmills, and trees. The storm came from the southwest; the length and width of the path are unknown. The amount of damage was not reported.

ERRATA

September 1945, page 66: Mean temperature, departure, and date of maximum temperature at Lexington should be 69.6, + 0.8, and 4th, respectively. Date of minimum temperature at Mount Vernon should be 15†. Mean temperature and departure at Nevada should be 71.8 and + 2.3, respectively.

January 1946, page 1: Total degree days at Springfield should be 942. Page 2: Mean temperature and departure at Springfield should be 34.6 and + 2.3, respectively. Page 7: Maximum and minimum temperatures on 7th at Springfield should be 42 and 30, respectively; mean maximum should be 43.1.

VOL. L APRIL 1946 No. 4

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

April was considerably warmer and slightly drier than normal, with about normal sunshine. It was a very favorable month for outdoor work, crop growth and field work.

The unseasonably mild weather which had prevailed since the first of the year continued during April, making the four months, January to April 1946, inclusive, the warmest comparable period in the 59 years that State-wide records have been kept. The first four months of 1921 and of 1938 were the previous warmest first four months, respectively, of any year since 1887. Above-normal temperatures this month were State-wide, all three divisions of the State averaging approximately 4°, or more, in excess of their respective normals, and each reporting station had average temperature well above normal. The 1st was generally the warmest day of the month, with afternoon temperatures in the high 80's or low 90's. The 12th and 17th were the coldest days, as a rule, with minimum temperatures generally in the high 20's to the middle 30's, and the formation of locally heavy to killing frost, did some damage to tender vegetation and fruits on those dates. The central counties, adjacent to the Missouri River, and the south-central Ozark counties, suffered the greatest amount of damage by the frosts and freezing temperatures, but even in those areas the amount of damage was decidedly variable, depending on exposure and topography. As a rule, crops on hillsides and higher ground escaped damage, while in the valleys they were damaged. Warm periods were from the 1st to 8th, 13th to 15th, and 18th to 25th, with cool periods from the 9th to 12th, 16th to 17th, and the last 5 days of the month. There were no unusual extremes of temperature recorded, for the month as a whole; however, the maximum on the 1st was the highest of record for that date, at some stations. The extreme low temperature of 25°, for the month, was the highest minimum since 1941 and only 5 times in the past 59 years has April had a minimum as high or higher.

Precipitation was again irregularly distributed ranging from 6.41 inches at the station having the greatest monthly total to 0.44 inch at the station with the least monthly amount. The Northern Division was the driest section of the State, with an average of 2.28 inches, or 1.18 inches less than normal. The Southwestern Division received an average of 3.95 inches, or 0.25 inch less than its normal, while the average for the Southeastern Division was 3.87 inches, or 0.56 inch less than normal. Snowfall was unimportant and confined to the extreme northeastern counties, with only one station recording more than a trace. Showers were frequent enough and generally adequate for all current requirements, although more rain was needed the latter part of the month over most of the northern half of the State. However, a fine, slow, soaking rain on the last two days of the month brought adequate moisture to that area.

There were no damaging storms of any kind during April, although light hail fell on several days, at various places. River stages were generally receding throughout April. A minor flood continued from the preceding month to about the middle of April in the Mississippi River from Keokuk to Grafton, and until April 4th at Cairo, Ill.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Wilderness Lookout is Lampe.

Continued from page 25

All field and garden crops made good growth and development during the month. Wheat and oats, as well as pastures and meadows, were in very good to excellent condition at the close of April. However, there were reports of Hessian fly damage, to wheat, in some fields. Corn planting made very good progress and was about 40% completed during the month, greatest progress being made in the southern part of the State, where about 60% of the corn crop had been planted. Cotton in the southeastern counties was mostly planted and some was up to good stands. Fruit prospects were unusually good, as a rule, except where damaged locally in central and south-central areas by frost and freezing temperatures. Strawberries were being picked in the extreme southern part of the State during the last week of April. First cutting of alfalfa was begun during the second week and continued throughout the remainder of the month. Blue-grass was heading in the northwestern counties the latter half, and this is the earliest that can be remembered. Everything was about a month advanced and prospects for above average crop yields were very good at the end of April.—M. R. W.

TEMPERATURE

The monthly mean for the State, 99 stations reporting, was 59.6°, or 4.3° warmer than the 59-year April average. The highest monthly mean was 64.4° at Caruthersville, and the lowest was 54.6° at Memphis. The highest reported was 94° at Anderson and Ozark Beach, on the 1st, and the lowest was 25° near Black, on the 17th.

PRECIPITATION

The average for the State, 210 stations reporting, was 3.37 inches, or 0.66 inch less than the 59-year April average. The greatest monthly amount was 6.41 inches at Anderson, and the least was 0.44 inch at Tarkio. The greatest amount reported in 24 hours was 3.05 inches at Anderson, on the 23d. The average number of days with 0.01 inch, or more, was 8.

Only a few stations, all in the extreme northeastern counties, reported snowfall, generally only a trace. The greatest monthly amount reported was 0.2 inch at Kahoka.

MISCELLANEOUS PHENOMENA

Aurora.—23d.

Duststorms.—3d, 4th.

Floods.—In Mississippi River, in the reach from Keokuk to Grafton, continued from March to April 19th; at Louisiana on 21st; at Cairo, Ill., continued from March to April 4th.

Frosts.—Light, 5th, 9th, 11th, 12th, 13th, 15th, 16th, 17th, 18th, 26th, 27th; heavy, 9th, 12th, 13th, 17th, 27th; killing, 12th, 17th.

Fogs.—Heavy, 5th, 6th, 10th, 11th, 12th, 22d, 28th, 29th, 30th.

Hail.—Light, 3d at Unionville; 5th at Caplinger Mills and Springfield; 7th at Farmington; 8th at Pierce City; 14th at Brunswick and University of Kansas City; 22d at University of Kansas City.

Windstorms.—No damaging winds reported.

ERRATA

January 1946, page 2: Date of greatest 24-hour precipitation at Lakeside should be 8–9th.

February 1946, page 9: Per cent of sunshine at Kansas City Airport should be 78.

March 1946, page 17: Degree days at Springfield should be 326.

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Wind-shield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. † Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for April 1946

(See precipitation data in daily precipitation table)

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

May was a decidedly cool and wet month, this year, and not nearly as favorable for outdoor work and crop growth and development, excepting oats and grasses, as the two preceding months of the current growing season. At the beginning of May all field work and growing crops were about a month ahead of normal advancement, but by the close of the month much of this advancement had been overcome by the frequent rains and persistent cool weather.

It was the second consecutive month of its name with average temperature 3.0°, or more, below normal; however, last May averaged approximately 1.0° cooler than the current month. In the past 59 years only nine Mays have had a lower average temperature than the 61.4° for this month. Frost or freezing temperatures occurred on the 11th or 12th at numerous stations in the Northern Division of the State, and locally at two, or more, stations in each of the other two divisions. However, practically no damage resulted, although locally at Conception and Maryville the frosts were recorded as killing. The cool weather was persistent throughout the entire month, only a very few days averaging normal, or above. The sub-normal temperatures were general over the entire State, all reporting stations showing monthly averages of 2.0° to more than 5.0° lower than their respective normals. There were no unusual extremes of temperature recorded anywhere in the State, considering the month as a whole.

It was the wettest May since 1943 and the second wettest in the past eleven years, but there have been numerous months of same name that have had more rainfall than the current month. Precipitation was quite frequent during the month, measurable amounts occurring on an average of 14 days, for the State as a whole, while a few individual stations had measurable rain on as many as 20 days during May. The distribution of the month's rainfall was rather irregular, ranging from a total of 13.83 inches, at the wettest station, Crane Mountain, to only 2.82 inches at Edgerton, the station receiving the least monthly amount. The distribution by Divisions, with departures from normal, was as follows:—Northern Division, 5.05 inches, +0.39; Southwestern Division, 6.50 inches, +1.26; Southeastern Division, 9.09 inches, +4.51; for the State, 6.88 inches, +2.05. Heavy local showers caused rapid rises in some of the smaller streams of the State, resulting in overflows and considerable crop and property damage, but estimates on monetary losses are not yet available. One man was drowned on May 2d in a flash flood in Panther Creek, near Breckenridge, Mo., when his car was swept downstream as he attempted to cross the swollen stream, that overflowed the highway. Unofficial reports of 7 inches of rain in three hours, on the 2-3d, were reported from this vicinity. At Neosho an official measurement of 3.33 inches in one and one-half hours was reported on the 30th. Joplin reported 4.43 inches in 24 hours the same day. At Granby 5.50 inches fell in a 24-hour period on the 30th, while at Sikeston, 4.96 inches fell in a similar period on the 24-25th. Considerable damage resulted from flooding of the Black River at Poplar Bluff, on the 25th and 26th, and reports of flood damage at Newburg, Mo., Phelps County, on the 24th were received. There were only minor, local overflows in some of the larger streams and rivers of the State, but no flood stages were reached in either the Missouri or Meramec Rivers.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Irouton; Wilderness Lookout is Lampe.

Continued from page 33

Sunshine for the month averaged approximately 10% less than normal, for the State as a whole. The average number of cloudy days was 12, or 4 more than normal.

Severe storms (tornadoes, high winds, and hail) occurred on the 23d, particularly in the northwestern quarter of the State, and resulted in severe property damage, and the death of two persons. For details see the table of severe storm damage printed elsewhere in this issue.

The cool, wet weather, which prevailed throughout the month, was favorable for the growth of oats, meadows, and pastures, but unfavorable for the corn and cotton crops and seriously interfered with the harvesting of hay crops. Corn planting was delayed and fields which had been planted became grassy and weedy from lack of cultivation, due to continued wet fields. Much replanting of corn was necessary. Wheat prospects declined during the month and there was some lodging due to rank growth and strong winds. However, a rather serious infestation of the Hessian fly in some areas was checked by the cool, wet weather. In the extreme southeastern counties it was too wet and cool for cotton; fields became grassy and much replanting was necessary, while some fields were abandoned to be planted to other crops. Fruit prospects, particularly peaches, were very good at the end of May. Warm, dry weather was badly needed as the month closed.—M. R. W.

TEMPERATURE

The monthly mean for the State, 98 stations reporting, was 61.4°, or 3.1° below the 59-year May average. The highest monthly mean was 66.1° at Caruthersville, and the lowest was 57.5° at Unionville. The highest reported was 87° at Clinton and Sweet Springs, on the 24th, and at Brookfield and Kansas City Airport, on the 30th; the lowest was 30° at Kidder and Maryville, on the 11th.

PRECIPITATION

The average for the State, 209 stations reporting, was 6.88 inches, or 2.05 inches more than the 59-year May average. The greatest monthly amount was 13.83 inches at Crane Mountain, and the least was 2.82 inches at Edgerton. The greatest amount reported in 24 hours was 5.50 inches at Granby, on the 30th. The average number of days with 0.01 inch, or more, was 14.

There was no snowfall recorded anywhere in the State.

MISCELLANEOUS PHENOMENA

Earthquake.—On 15th; felt at Doniphan and Poplar Bluff and other southeast Missouri points.

Floods.—In Black River, at Poplar Bluff, 2d to 4th; 18th to 20th; 26th to 28th; at Leeper on 25th. In Grand River, at Chillicothe, 3d to 5th and 6th to 7th. In Gasconade River, at Jerome, on 26th. In Mississippi River, at Louisiana, on 4th. In St. Francis River, at Fisk, on 2d and continued into June.

Fogs.—Heavy, 1st, 2d, 6th, 7th, 12th, 15th, 17th.

Frosts.—Light, 5th, 7th, 8th, 9th, 11th, 12th, 21st; moderate, 12th; killing, locally on 11th and 12th in Nodaway County.

Hail.—Light, on 2d at Knoxville and Sedalia; 10th at Altona and St. Louis University; 15th at Kansas City Airport and Warrensburg; 17th at Caruthersville and Sikeston; 19th at Seymour; 20th at Bethany; 23d at Amity, Bethany, Elsberry, Grant City, Oregon, St. Joseph, Napeoleon, Martin City, and in Carroll County; 24th at New Florence, Lockwood, and Springfield; 25th at Seymour; 30th at Amity, Kidder, King City, and Seymour. Moderate.—On 19th at Lockwood; 23d in northwest Platte County, Burlington Junction, and Ravenwood; 24th at Waynesville. (See special storm table). Heavy.—On 24th at Rolla and vicinity. (See special storm table).

Tornadoes.—On 23d. (See special storm table).

Windstorms.—23d, 24th. (See special storm table).

OBITUARY

Mr. A. L. Hailey, Cooperative Observer at Seymour(near), passed away on May 1, 1946, at the age of 81 years. Mr. Hailey served as Cooperative Observer from January 1933, until shortly before his death. However, the station has been in charge of the Hailey family since its establishment in August 1920, when Mr. Ira H. Hailey, the son of Mr. A. L. Hailey, became the official observer and served until November 1932. Mr. Ira H. Hailey again took over as official observer following his father's

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Windshield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. ‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for May 1946

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

(Continued from page 35)

passing.

The Weather Bureau and the Seymour community have lost a fine public servant in the passing of Mr. A. L. Hailey, and both are deeply indebted to him for the valuable climatic record compiled during his tenure as Cooperative Observer in Webster County.

ERRATA

March 1946, page 18: Date of greatest 24-hour precipitation at Lakeside should be 22-23d.

Daily Temperatures for May 1946

Missouri Storms, May 1946

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Northwest Platte..	23	About 6:00 p.m.	Moderate to light hail	nw.	2	2	0	Slight	Occurred in Marshall, Weston and Green townships. Stones ranged in size from hazelnuts to black walnuts. No crop damage. Accompanied by considerable wind and rain.
Nodaway..........	23	Between 6 and 7 p.m.	Moderate hail	sw.	2	10	0	Very little	Occurred at Burlington Junction and eastward to 8 miles northwest of Maryville. Stones were from $\frac{1}{4}$ to $1\frac{1}{4}$ inches in diameter; a few 11 inches in circumference were reported. Hard hail also reported near Ravenwood. Wheat, oats, and rye were damaged. Storm was accompanied or preceded by tornadic winds.
Atchison, Andrew, Holt and Nodaway	23	Between 5 and 7 p.m.	Tornadoes and straight-line winds	sw.	$\frac{1}{8}$ to $\frac{3}{4}$	About 40	0	From $180,000 to $270,000	A series of tornadoes and windstorms prevailed over portions of the four counties, with Nodaway County suffering the greater part of the damage. Altogether four persons were injured, none seriously. Damage was mostly in rural areas to farm homes, outbuildings, barns, trees and comunication and power lines. Places near which the storms struck and where most of the damage occurred were Craig, Mound City, and Oregon in Holt County; Arkoe, Bedison, Burlington Junction, Pickering, Skidmore, Ravenwood, and Wilcox in Nodaway County, Rosedale, Clay township in Andrew County; and in the southeast corner of Atchison County. Crop damage in Nodaway County was estimated at $30,000 to $50,000. Considerable livestock and poultry were killed or injured.
La Fayette, Ray and Carroll........	23	6:30 p.m. to midnight	Tornado	sw.	100 to 600 feet	About 50 to 60	0	$504,650	Occurred at Napoleon and vicinity, in La Fayette County; at Richmond and in southeast Ray County; at Stet, Carrollton and in Prairie, Leslie and Ridge townships, and at Tina in Carroll County. Storm was accompanied by light hail. except at Tina. Thirteen persons were injured. Damage was to houses, barns, outbuildings, corn and hay in storage, gardens and some livestock. No crop loss, except to those in storage and to gardens. It was reported that three storms occurred in Carroll County, all occurring very closely together.
Jackson	23	6:25 p.m. to about 6:40 p.m.	Tornado	sw.	$\frac{1}{3}$	About 11	2	$290,000	Storm originated a little south of Martin City and moved north-northeast through Holmes Park to the southeast corner of Swope Park, at 67th St., and Route 50. Storm was accompanied by light hail. Many buildings destroyed or damaged; 8 head of cattle and several hundred chickens killed; trees uprooted or broken; one person was seriously injured. Damage to crops in fields $2,500; in storage $10,000; to livestock and poultry $2,500 with balance of total to property. Much damage also to telephone lines.
Platte	23	7:30 p.m. to about 7:38 p.m.	Tornado	sw.	200 feet	5	0	$5,000	Originated about 5 miles southwest of Barry and moved northeastwardly to the east side of Barry. Damage was to buildings, trees, telephone and power lines. Several ckickens were killed. No persons were injured in this storm.
Phelps	24	11:00 a.m. to 11:30 a.m.	Straight-line winds and heavy hail	sw.	Narrow	Several	0	Small	Occurred at Rolla and vicinity. Wind damage to trees. Crop damage from hail estimated at $2,000 to corn, wheat, and gardens. Hailstones were approximately $\frac{1}{2}$ inch in diameter and drifted in places to a depth of 8 inches and remained there for 24 hours.

Vol. L   June 1946   No. 6

Price: 5 Cents a Copy; 25 Cents a Year

GENERAL SUMMARY

The past month averaged slightly warmer and considerably drier than normal, for the State as a whole. It was a favorable month for crop growth and development and for most outdoor activities.

The unusually cool, wet weather, which prevailed during the preceding month of May, gave way to much warmer and drier weather after the first few days of June and the remainder of the month averaged considerably warmer than normal, although no unusually high temperatures were reported. The 16th and 17th were generally the warmest days of the month and several cases of heat prostration were reported. The only decidedly cool period occurred during the first four or five days of the month, the 3d and 4th being the coldest days, as a rule, with minimum temperatures ranging from the high 30's to the middle 40's, generally. A moderately cool period prevailed on 20th and 21st. Each of the three divisions of the State had monthly temperature averages of less than 1° above their respective normals; however, several individual stations, in scattered areas of the State, averaged cooler than normal.

Precipitation was irregularly distributed during June, ranging from a monthly total of 9.19 inches at Edgerton to only 0.35 inch at East End. Showers occurred on an average of only 6 days, over the State as a whole, compared to 14 days during May, thus permitting resumption of the cultivation of field crops, which had been seriously curtailed by the wet weather during May. The Northern Division received the greatest amount of rain during June, the average being 3.93 inches, which is only 0.87 inch less than normal. The Southeastern Division received the least rainfall, the average being 1.78 inches, or 2.52 inches less than normal. The average for the Southwestern Division was 2.44 inches, or 2.62 inches below normal. Rather heavy rainfall, three to more than four inches in a 24-hour period, occurred locally on the 29-30th in each of the three divisions of the State, the greatest amount being 4.10 inches at Cassville.

A moderate flood occurred in the Mississippi River, in the reach from the Iowa-Missouri border to Dam No. 25, from the 19th to 27th, while minor overflows occurred in portions of the Grand and St. Francis rivers.

Severe or damaging storms were relatively few during the month and these are tabulated elsewhere in this issue.

The warmer and drier weather, which set in after the first few days of June, greatly aided all growing crops, except pastures, and allowed cultivation of fields that had become weedy and grassy during May, due to persistent unusually cool and wet weather. Corn planting was mostly completed during the month, with considerable replanting necessary because of poor stands and weedy and grassy fields. The crop made good progress after the first week, and was well cultivated and growing nicely by the end of the month, although it was in need of more rain, at that time, in some areas. In the southern part of the State, some fields were in the silk and tassel stage as the month closed. Wheat and oats made excellent progress during the month, and harvest of barley and wheat began during the first few days of June, which is about two or three weeks earlier

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Wilderness Lookout is Lampe.

Continued from page 41

than usual. Wheat harvest continued throughout the month, while oat harvest began about the middle and continued during the latter half. Yields of wheat and oats were generally better than expected; however, there was some damage to wheat in several areas by Hessian fly and rust. Planting of soybeans was started early in June and was mostly completed by the close of the month, with early planted fields making good progress, although in need of more moisture in the drier areas of the State. Hay harvest continued throughout most of the month, and a large quantity of good to excellent quality hay was saved. Cotton in the southeastern counties was in poor condition the first part of June, but made rapid progress during the latter half, after fields were cultivated and cleaned of grass and weeds. Some cotton fields had poor stands due to the cool, wet weather in May and early June. Pastures were not as good this month as in May and were in need of more rain in many parts of the State, after about the middle of the month. The rather sudden change from the cool, wet weather of May, and the first few days of June, to comparatively dry and hot weather after about the first week of June, proved unfavorable for pastures, in those areas where rainfall was inadequate. Fruit prospects continued good during June and the harvest of a fine crop of early peaches was under way during the second week.—M. R. W.

TEMPERATURE

The monthly mean for the State, 98 stations reporting, was 73.9°, or 0.3° above the 59-year June average. The highest monthly mean was 78.1° at Kansas City University, and the lowest was 70.6° at Seymour. The highest reported was 104° at Tarkio, on the 15th, and the lowest was 37° at Edgerton and Tarkio on the 3d and at Edgerton and near Black on the 4th.

PRECIPITATION

The average for the State, 206 stations reporting, was 2.72 inches, or 2.00 inches less than the 59-year June average. The greatest monthly amount was 9.19 inches at Edgerton, and the least was 0.35 inch at East End. The greatest amount reported in 24 hours was 4.10 inches at Cassville, on the 30th. The average number of days with 0.01 inch, or more, was 6.

MISCELLANEOUS PHENOMENA

Floods.—In Grand River, at Chillicothe, 20th to 21st. In Mississippi River, in the reach from Keokuk, Iowa to Dam No. 25, 19th to 27th; also on 1st, 16th to 17th, and on the 30th and continuing into July at Louisiana. In St. Francis River, at Fisk, continued from May to June 9th.

Fogs.—Heavy, 2d, 19th.

Hail.—Light, on 1st at Columbia and St. Louis; 10th at Campbell; 12th at Brunswick, Edina, Shelbina, and Keokuk, Iowa; 15th at Browning and in northeastern Cooper County; 19th at St. Louis University. Moderate, on 15th at Knoxville and locally in Sullivan County. (See special storm table). Heavy, on 10th near Campbell. (See special storm table).

Tornado.—On 30th. (See special storm table).

Windstorms.—1st, 10th, 18th, 19th, 28th. (See special storm table).

OBITUARY

Mr. Martin L. Comann, Cooperative Observer at the St. Charles station since September 12, 1933, died on June 6, 1946, at the age of 81 years. Mr. Comann served faithfully and well and gave gratuitously of his time and effort in adding nearly thirteen years of record, to the already long climatic record previously compiled for St. Charles. The Weather Bureau and the citizens of St. Charles will be forever indebted to him for his service in the interest of the general public.

ERRATA

April 1946, page 27: Greatest 24-hour precipitation and date at St. Louis Airport should be 1.00 on April 30th–May 1st.

May 1946, page 35: Greatest 24-hour precipitation at St. Louis(City Office) should be 2.26. Page 38: Wind movement on 4th at Columbia should be 91; total movement should be 1593.

October 1945, page 74: Mean temperature at Albany should be 54.4. Number of days with 0.01 inch, or more, of precipitation at Marshall and Seligman should be 4 and 7, respectively. Page 79: Mean minimum temperature at Mountain Grove should be 46.1.

May 1945, page 33: In comparative data table the number of partly cloudy and cloudy days should be 9 and 12, respectively.

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

Missouri Storms, June 1946

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
St. Louis City	1	Between noon and 2:00 p.m.	Thunderstorm and wind	nw.	No definite storm path	No definite path	0	Small	Some streets flooded and sewer lids lifted from openings. Only minor damage to trees, wires and poles locally in southwest section of the city. Light hail fell for a few minutes.
Dunklin	10	6:00 p.m. to 6:30 p.m.	Heavy hail and wind	se.	5	4	0	Not estimated	Storm occurred 4 miles from Campbell. 30% damage by wind and hail to orchard crops. Fruit trees blown down or limbs broken. Hail damage to fruit. Hailstones one inch in diameter.
Livingston, Carrol, Charitan, Saline, and Cooper	15	Between midnight and 5:00 a.m.	Straight-line wind	w. or nw.	8 to 10	Approximately 60	0	$31,000 in Livingston and Cooper Counties. Unknown in other counties	Storm extended from Chillicothe to Boonville and vicinity. Growing crop damage estimated at $6,500 to wheat, rye and oats; $500 to hay and grain in storage. Storm accompanied by severe lightning which did 5% of the estimated damage Trees, old buildings, barns and power lines damaged by wind and lightning. In Cooper County storm was accompanied by light hail.
Sullivan	15	Between 7 and 9 a.m.	Straight-line wind and moderate hail	sw.	5	15	0	$2,500	Storm extended from southwest of Milan to Pollock. A few small buildings destroyed. Corn and small grain blown down. No material damage to crops.
St. Louis and St. Louis City	18	Between 6:15 p.m. and 8:00 p m.	Thunderstorm and wind	nw.	....	....	0	Minor	Trees uprooted, power lines disrupted and shingles blown from roofs and a plate glass broken by wind in parts of St. Louis and suburbs.
Jefferson and St. Louis, and City of St. Louis	19	Between 6:15 p.m. and 8:30 p.m.	Thunderstorm and wind	nw.	10	30	0	Not available	Trees and transmission lines blown down or broken down. Chimney of one residence in St. Louis City struck by lightning, damaging the building. Storm extended into Illinois striking Dupo, Ill.
Livingston	30	Between 6:30 p.m. and 7:40 p.m.	Local tornado	sw.	1	Not reported	0	Not reported	Storm struck Chillicothe and vicinity severely damaging two buildings at the Industrial Home for Girls. Trees and wires were blown down or broken. Heavy rain accompanied the storm; nearly one inch fell in about 15 minutes. Rotary winds reported but no one injured. Crop not severely damaged.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

Vol. L — July 1946 — No. 7

Price: 5 Cents a Copy; 25 Cents a Year

GENERAL SUMMARY

July was both warmer and drier than normal but it was generally a favorable month for growing crops, except in some scattered local areas where droughty conditions prevailed throughout the month and where crops suffered severely.

The Southwestern Division had the highest average temperature with 80.1°, which is 2.4° above normal. The average for the Southeastern Division was 78.8°, or only 0.5° warmer than normal; for the Northern Division the average was 77.7°, or 0.7° above normal. Afternoon temperatures of 100°, or higher, occurred on an average of three days, for the State as a whole, and on an average of six days over the Southwestern Division. The 18th, 19th, 23d and 24th were the warmest days of the month, as a rule, while the 2d, 3d, and 4th were generally the coolest days, when minimum temperatures were in the 50's or high 40's. The extremes of temperature this month were well within the all-time extremes for July.

Precipitation was mostly of the summer-thundershower type and the distribution was quite irregular, ranging from a total of 8.15 inches at the station receiving the greatest monthly total to only a trace at the station with the least monthly amount. A number of stations in scattered areas of the State received less than an inch of rainfall during the month. The driest areas were in the extreme southwestern corner of the State, several east-central counties bordering on the Missouri and Mississippi rivers, and locally in Knox, Lewis, Ralls, and Shelby counties, in the northeastern quarter of the State; also, in Platte, DeKalb, Gentry, Harrison, and northern La Fayette counties. Heavy local rainfall occurred in the extreme northeastern counties on the 16-17th, when 7.55 inches fell within a 24-hour period at Memphis, Scotland County, resulting in severe flooding of small streams in that area. Heavy local downpours of more than four inches occurred at Wappapello Dam on the 20th-21st and at Mt. Vernon on the 28th.

Only a very few damaging storms occurred during the month, all of which were strictly local and are tabulated elsewhere in this issue.

Minor flooding occurred in the Grand River, at Chillicothe, the first two days of the month and in the Mississippi River at Louisiana the first half of July; also, in the reach from Hannibal to Louisiana from the 19th to 20th. Rather severe flooding of small streams in the extreme northeastern counties, particularly the Fox River, occurred following heavy rainfall in that area on the 16-17th.

Harvesting and threshing of small grains was completed during the month, except in the northern portion of the State where threshing was still in progress at the close. Yields were very good, especially oats, which were the best in several years. Corn, as a rule, made good progress, except locally in the drier areas of the State, and the crop was expected to be the best in many years. By the close of the month the bulk of the crop was in the critical silk and tassel stage of its development and rather general showers during the last week of July were especially beneficial and timely. Hay making continued throughout the month under favorable weather conditions and

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Pilot Knob is Ironton; Wilderness Lookout is Lampe. (C) Airport.

Continued from page 49

yields and quality were generally good. Pastures were unusually good for the time of year, except in the dry areas where they were showing the effects of hot dry weather. In some of the drier localities water supplies were becoming short the latter part of the month. Cotton in the extreme southeastern counties made good progress and was blooming profusely as the month closed. Some preparation of fields for seeding of fall grains was accomplished the latter part of July, where rainfall was adequate. Harvest of early peaches was completed during the month and the late crop was about ready the closing week in the southern part of the State. Truck and garden crops made good progress, except in the dry areas, and early potatoes in commercial producing areas were harvested during the month.—M. R. W.

TEMPERATURE

The monthly mean for the State, 99 stations reporting, was 78.9°, or 0.8° above the 59-year July average. The highest monthly mean was 83.5° at Joplin, and the lowest was 74.9° at Unionville. The highest reported was 107° at Nevada on the 19th and 24th and at Warsaw on the 24th, and the lowest was 48° at Warrenton on the 4th.

PRECIPITATION

The average for the State, 209 stations reporting, was 2.68 inches, or 0.85 inch less than the 59-year July average. The greatest monthly amount was 8.15 inches at Fayette, and the least was only a Trace at Joplin. The greatest amount reported in 24 hours was 7.55 inches at Memphis on the 16-17th. The average number of days with 0.01 inch, or more, was 5.

MISCELLANEOUS PHENOMENA

Auroras.—26th, 27th.

Floods.—In Grand River, at Chillicothe, from June 30th to July 2d. In Mississippi River, at Louisiana, continued from June to July 15th; also, in the reach from Hannibal to Louisiana from July 19th to 20th.

Fogs.—Heavy, 6th, 17th, 30th.

Hail.—Light, on 10th 12 miles southeast of Butler; 27th near Cuba; 28th at Pierce City. Heavy, on 19th near Elsberry; 26th at Butler. (See special storm table).

Windstorms.—10th, 16th, 27th, 28th. (See special storm table).

ERRATA

June 1946, page 47: Maximum temperature at St. Louis on 4th should be 73.

Missouri Storms, July 1946

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
New Madrid	8	....	Thunderstorm	......	....	....	1	....	A young girl was struck and killed by lightning near Gideon.
Bates	10	Evening	Wind, hail and lightning	......	....	....	.	....	Occurred 12 miles southeast of Butler. Details not available.
Sullivan	16	6:00 p.m.	Straight-line wind	wnw.	....	....	0	Slight	Occurred a few miles north of Browning. "Some corn blown down; little damage otherwise."
Lincoln	19	6:00 p.m. to 6:15 p.m.	Heavy hail	nw.	¼ to 1	3 to 6½	0	Not reported	Storm occurred 5 miles north of Elsberry, extending to the Mississippi River from about 5 miles to the west. Reports from two farms affected reported damage to corn, soybeans, fruit, roofs, and 21 broken windows. Hailstones averaged ½ inch with some 1 inch in diameter.
Bates	26	During night	Heavy hail and wind	......	....	....	0	Unknown	Details not available. Observer at Butler reported "Much hail, electricity, and wind northeast night of 26th."
Boone	27	Early morning	Thunderstorm and wind	sw.	....	....	0	$500	A house trailer was crushed and demolished by a falling tree limb and one person was slightly injured at a trailer camp near Columbia. Lightning set fire to a small garage badly damaging it. A 40-acre pasture was set afire by lightning and burned off, 2 miles north of Columbia, during this storm.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

Locally heavy to excessive rainfall, at some stations unprecedented, was the outstanding characteristic of August 1946. Paradoxically, however, severe drought continued to grip several extreme southwestern counties of the State, while several others in the west-central, central, and east-central sections received too much rain during the month. For the State, as a whole, however, the cool, wet month was highly favorable for crop growth and development, and a record yield of soybeans and near-record yield of corn was indicated at the close of the month.

It was the coolest August since 1927 and the tenth coolest of its name since State-wide records began in 1888. Each of the three divisions of the State averaged cooler than their respective normals, although some individual stations had above-normal averages for the month, these being mostly in the Southwestern Division. The average for the latter division was 76.0°, or 2.3° and 3.0°, respectively, higher than the average for the Northern and Southeastern divisions. Hot weather prevailed over most of the southwest and west-central portions of the State during most of the first half of August, and afternoon temperatures reached 100°, or higher, on several days, at a number of stations, while the remainder of the State enjoyed comparatively mild temperatures. The last decade, as a rule, averaged cooler than normal, particularly the last four days, which were the coolest of the month, and it was during that interim the minimum temperatures for the month occurred; lowest readings were in the 40's and 50's. The extreme low this month, 37° at Tarkio on the 29th, equalled the all-time low record for August, the only other occurrence being in 1915. The highest temperature this month, 111°, was 5° under the record-high for August. Maximum temperatures of 100°, or higher, and 90°, or higher, occurred on an average of 1 day and 10 days, respectively, for the State as a whole; in the Southwestern Division the averages were 3 and 15 days, respectively.

Precipitation was very irregularly distributed during the month, ranging from a total of 20.45 inches at St. Louis (City Office) to only 0.83 inch at Ozark Beach. The average for the Northern Division was 4.67 inches, or 0.90 inch more than normal; the Southwestern Division 5.63 inches, +1.67; the Southeastern Division 6.61 inches, +2.79; for the State 5.64 inches, +1.79. These averages are not unusual and were exceeded in each instance in 1944, except for the Southeastern Division, where the current month was the wettest August since 1915 and the third-wettest of that name in the past 59 years. The outstanding feature of this month's precipitation was the unusually heavy to excessive local rains, which fell over a large area extending across the central and south-central portions of the State and extending into western Illinois, from the 13th to 16th, resulting in the drowning of three persons, heavy property damage, and enormous soil erosion damage, the amount of which will never be known. In St. Louis, where the heaviest rainfall was concentrated, 8.78 inches fell in a 24-hour period and 13.57 inches in a 48-hour period on the 14-16th, thus estab-

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

Continued from page 57

lishing a new all-time 109 year record for that station. A heavier 24-hour fall, however, occurred previously in the State when 12.25 inches fell at Grant City on July 10th, 1922. In the Southwestern and Northern divisions 24-hour amounts of 8.20 inches at Lakeside on the 14-15th and 5.42 inches at St. Charles on the 15-16th, respectively, were recorded. The monthly total of 20.45 inches at St. Louis City was the greatest monthly total for any month at that station, but for the whole State, atotal of 25.54 inches for May 1943, at Joplin, still stands unbroken as the greatest amount for any month. A number of stations had monthly totals in excess of 10 inches during this August, setting new records for those stations, but the total length of the record at most stations is relatively short, as compared to the St. Louis record. Several stations reported rain on as many as 15 or 16 days during the month, but the average for the State, as a whole, was only 9 days.

Despite the heavy to excessive precipitation, floods in the major streams of the State were not particularly serious, except in the Gasconade and Osage rivers, because stages were relatively low before the heavy rains occurred and also because the rains were local rather than general. However, rapid and strong rises did occur in both the Mississippi and in the lower Missouri rivers, with some minor overflowing of the latter at St. Charles and below. Flash floods in the smaller streams followed the torrential local rains from the 13th to the 16th and in towns and cities, particularly St. Louis and suburbs, sewer and drainage systems were overtaxed, resulting in serious flooding of streets, basements, and low areas. Two boys were drowned at St. Louis while swimming in a flooded street. A third person was drowned at Elsberry as a result of flood waters.

Damaging storms were not unusual, in either frequency or severity, during the month; details are tabulated elsewhere in this issue.

Corn and soybeans made good progress during the month, except in the dry southwest section where all crops suffered severely from drought and hot weather the first half. Some corn was also damaged by flood waters of the Osage and Gasconade rivers. At the closed of the month the bulk of the corn crop was far enough advanced to escape damage by frost occurring as early as the normal date. Some soybeans were cut for hay and lespedeza fields improved rapidly the latter half of the month, in most sections of the State, and a fair to good crop of hay was in prospect. Cotton made good growth and development the first half of the month, but was becoming rank and in need of cultivation and warmer and drier weather at the close. Much fall plowing was accomplished during the latter half of August, where fields were not too wet, and some small grains were sown for fall grazing. Pastures improved rapidly, following the fine rains during the middle of the month, and the cool weather and ample moisture were ideal for rapid growth. Threshing of small grains and the harvesting of a large peach crop was completed during the month. The drop of apples, in orchards located in the southwest part of the State, was heavy, due to the prolonged dry weather in that area.—M. R. W.

TEMPERATURE

The monthly mean for the State, 100 stations reporting, was 74.0°, or 2.5° below the 59-year August average. The highest monthly mean was 80.4° at Joplin, and the lowest was 69.5° at Unionville. The highest reported was 111° at Clinton and Warsaw, on the 8th, and the lowest was 37°, at Tarkio, on the 29th.

PRECIPITATION

The average for the State, 212 stations reporting, was 5.64 inches, or 1.79 inches more than the 59-year August average. The greatest monthly amount was 20.45 inches at St. Louis City, and the least was 0.83 inch at Ozark Beach. The greatest amount reported in 24 hours was 8.78 inches at St. Louis City, on the 15-16th. The average number of days with 0.01 inch, or more, was 9.

MISCELLANEOUS PHENOMENA

Auroras.—30th, 31st.

Floods.—In Gasconade River, at Jerome, 14th to 16th. In Meramec River, at Meramec Park (Sullivan), on 16th. In Mississippi River, at Louisiana, 2d to 6th, 14th, 16th, 21st,

Missouri Storms, August 1946

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
St. Louis City and County	5	Between 2:30 p.m. and 6:30 p. m.	Severe thunderstorms, high wind and local tornado	sw.	Approximately 4 to 5	About 15	0	$100,000	Storm apparently originated near Valley Park and moved northeastward into Illinois, with the bulk of the damage in downtown St. Louis as a result of lightning striking and setting afire two large buildings, as well as smaller buildings. Trees and limbs were blown down and power and communication service disrupted in scattered places throughout the affected area. A small local tornado demolished a hangar at Sylvan Beach airport and damaged several planes. Five persons were slightly injured either directly or indirectly by the thunderstorms. Heavy downpours of rain accompanied the severe electrical disturbances. Places reporting damage besides St. Louis City were Valley Park, Kirkwood, Webster Groves, Richmond Heights, University City; East St. Louis and Granite City, Ill. Corn was damaged extensively by wind in the Valley Park area.
Cole	5	Between 3 and 4 p.m.	Thunderstorm and wind	......	....	....	0	Not reported	At Jefferson City trees and wires were damaged and power and communication service disrupted. About 500 telephones were knocked out. Storm was accompanied by heavy rain.
Lincoln	5	....	Not known	......	....	....	1	....	A farmer of near Troy was electrocuted in attempting to remove a live wire from a wet tree limb.
Nodaway	7	During night	Thunderstorm and wind	......	....	....	0	Minor	Severe electric storm and strong wind; many limbs broken from trees.
Crawford	8	About 7:00 p.m.	Wind	nw.	....	....	0	Small	Trees uprooted and broken, some roofs damaged and power and communication lines and poles torn down. Wind estimated at sixty miles per hour. Storm was accompanied by hail, rain and lightning. Traffic on Highway 66 halted for one-half hour.
St. Louis City	8	During morning	Thunderstorm and wind	s.	....	....	1	Minor	A pedestrian was killed in a freakish accident when a chair was supposedly blown from a third floor window during a strong gust of wind. Street car service disrupted by electrical storm during the early morning rush hour.
Butler	9	Early night	Electrical and wind	......	....	....	0	Not reported	High wind and electric storm reported having swept southeastern Missouri early at night but no details available than other newspaper account. At Poplar Bluff three plate glass windows were shattered, awnings ripped away, trees uprooted and light service disrupted.
Shannon	9	Approximately 3:00 p.m. to 3:10 p.m.	Heavy hail and gusty wind	ne.	....	1	0	None	Storm occurred at Winona. Hail covered only a small wooded area. Stones were ⅜ inch in diameter with some stones ⅜ by 1 inch long appearing as two stones joined to-gether. No crops in vicinity. Heavy rain followed the hail.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

VOL. L SEPTEMBER 1946 No. 9

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

1947

September was both cooler and drier than normal, but it was a favorable month for crop growth and maturity, except in the extreme southwestern counties where drought conditions continued throughout the month. No killing frost occurred anywhere in the State during the month, although light frost formed locally on the 24th and 29th and more generally on the 30th, but without damage.

The sub-normal temperatures were general over the entire State, except locally at a few individual stations in the Northern and Southwestern divisions, where the monthly average was above normal. The average for the Northern Division was 66.9°, −1.0°; for the Southwestern Division 69.0°, −0.9°; for the Southeastern Division 68.0°, −2.1°. Warm periods were from the 5th to 10th and 25th to 28th, with cool periods from the 1st to 4th, 11th to 14th, and the last two days of the month. The 5th, 6th, and 7th were generally the warmest days, the maximum temperatures ranging from the high 80's to the middle 90's, as a rule. The 30th was the coldest day of the month; minimum readings registered in the low 30's to the low and middle 40's, generally. Temperature extremes were not unusual and were well within the extremes of past Septembers.

All of the month's precipitation was in the form of rain, no snow being reported anywhere in the State. The distribution was rather irregular, ranging from a monthly total of 9.77 inches at Oregon, to only 0.25 inch at Siloam Springs Lookout. A heavy fall of 5.85 inches on the 27th, at Oregon, with more than 4 inches of that amount occurring within an hour, resulted in a flash flood in small streams in that area and caused considerable property and crop damage. The Northern Division received the greatest amount of precipitation, with an average of 2.84 inches; this was 1.36 inches less than normal. The average for the Southwestern Division was 1.94 inches, --2.35 inches, and for the Southeastern Division 1.95 inches, −1.70 inches. For the State, as a whole, the average rainfall was 2.24 inches, −1.81 inches, which made this the driest September since 1940 and 7.21 inches drier than September one year ago, which was the wettest month of its name in the past 59 years.

River stages throughout the month were at relatively low levels in the major streams of the State, and no overflows occurred.

Only three damaging storms were reported and these are tabulated in the accompanying storm table.

Although precipitation averaged considerably less than normal for the month, except for the southwestern drought area, there was generally ample moisture for current needs, due to the heavy rainfall over much of the State during August and the rather frequent light to moderate showers this month. Corn continued to make good progress during the month, except in the drought area, and practically all of the crop was safe from frost damage by the close, with prospects for a near-record production. Soybeans also continued to make good progress and the current crop was expected to be the largest of

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. ^{4} Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

Continued from page 65

record. Pastures and lespedeza fields made very good growth and a good crop of lespedeza hay was cut and saved. Plowing for the winter wheat crop progressed throughout most of the month, except in local dry areas, where the ground was too dry and hard, at times, for this work. Considerable wheat, rye, and barley, for late pasture, were seeded during the month, but germination was rather slow in some areas because of dry soil. It was too cool and wet the first part of the month for cotton, but during the latter half the crop made good progress; bolls began opening, and picking and ginning were under way at the close of the month. Harvesting of the fall apple crop was in full swing during the latter half of the month. Livestock, as a rule, was in excellent condition and feed and forage supplies were more plentiful than for several years. Water supplies were very low in the drought area in the southwestern corner of the State, during September.—M. R. W.

TEMPERATURE

The monthly mean for the State, 96 stations reporting, was 68.0°, or 1.3° below the 59-year September average. The highest monthly mean was 72.2° at Joplin, and the lowest was 64.0° at near Black. The highest reported was 97° at Crystal City on the 26th, and the lowest was 32° at near Black on the 24th and at Licking on the 29th.

PRECIPITATION

The average for the State, 207 stations reporting, was 2.24 inches, or 1.81 inches less than the 59-year September average. The greatest monthly amount was 9.77 inches at Oregon, and the least was 0.25 inch at Siloam Springs Lookout. The greatest amount reported in 24 hours was 5.85 inches at Oregon, on the 27th. The average number of days with 0.01 inch, or more, was 6. There was no snowfall anywhere in the State.

MISCELLANEOUS PHENOMENA

Auroras.—17th, 18th, 23d.

Floods.—In Mississippi River, at Louisiana, flood stage or above occurred from the 8th to 9th; 13th to 15th; 17th; 20th; 24th to 29th.

Fogs.—Heavy, 2d, 3d, 4th, 9th, 10th, 11th, 12th, 13th, 15th, 17th, 18th, 20th, 21st, 22d, 24th, 30th.

Frosts.—Light, 24th, 29th, 30th; heavy, 30th.

Hail.—Light, on 1st at St. Louis Airport and in parts of St. Louis County and St. Louis City; 2d at Nevada; 9th at Kansas City Airport and Kansas City University; 22d at Maryville; 27th at Bethany. Moderate, on 1st in parts of St. Louis County and St. Louis City. Heavy, on 27th at Oregon and Forest City. (See special storm table).

Windstorms.—1st, 27th. (See special storm table).

ERRATA

March 1946, page 21: Precipitation on 2d, 6th, 7th and 13th, at Bernie, should be *.02*, *.38*, *.07* and *.01*, respectively; total precipitation should be $2.99.

August 1946, page 57: Lowest sea-level pressure at Kansas City Airport should be 29.68; page 59: Line 5, date of 24-hour precipitation at Lakeside should be 13–14th.

Missouri Storms, September 1946

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
St. Louis City and County	1	Between 4:00 p.m. and 5:00 p. m.	Wind, hail, electrical and heavy rain	nw.	¼	15	0	$20,000 to $25,000	Storm first struck vicinity of Lambert Field Airport, moving southeastward across the county into the city of St. Louis. Trees were uprooted and broken; power and communication lines and poles broken and service disrupted; roofs and cornices of a few buildings damaged. Two persons suffered minor injuries. Storm was accompanied by heavy rain which flooded streets and basements in low areas as sewers were overtaxed. Light to moderate hail also accompanied the storm with resultant damage estimated at $2,000 to $3,000. Stones were mostly the size of small marbles with some ½ inch in diameter. The southern section of the city suffered the greatest amount of damage. Crop damage was negligible.
Jackson	22	....	Electrical	......	....	....	1	unknown	Lightning struck and killed a 15-year old boy at Slayton Meadows golf course near Kansas City and damaged a church and a school building at Kansas City.
Holt	27	Between 7:40 p.m. and 8:45 p.m.	Wind, hail, electrical and heavy rain	ne.	8	25-30	0	$27,000	Storm struck Forest City and Oregon, with greater part of damage from flood waters caused by torrential rain. At Oregon more than 4 inches fell in an hours time. Crop damage to corn estimated at $3,000. Three persons were reported injured. Some chickens and hogs were drowned. Several bridges washed out. Heavy hail accompanied the storm with largest stones ¾ inch in diameter. Not much damage by wind to trees.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

ST. LOUIS, MO.

VOL. L — OCTOBER 1946 — No. 10

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

October, as usual in Missouri, was a very pleasant month and favorable for most outdoor activities and field work, except it was too dry over much of the southern half of the State for rapid germination and growth of fall-sown small grains and pastures. During the greater part of the month a fine type of Indian-summer weather prevailed and the mild temperatures resulted in a large saving of fuel and feed supplies.

It was the warmest October since 1941, and averaged 4.3° warmer than the same month a year ago. This mild condition was State-wide, each of the three divisions of the State having temperature averages well above their respective normals. Many sections of the State had not experienced a killing frost by the close of the month, although a number of stations, in scattered areas, reported killing frost on the 12th, which was generally the coldest day of the month; minimum temperatures dropped to the middle 20's or upper 30's, on the latter date. The 6th, 7th, and 8th were, as a rule, the warmest days of the month, with afternoon temperatures registering in the 80's or low 90's. No unusual extremes of temperature occurred anywhere in the State, except locally on the 30th, when maximum temperatures at some places were the highest of record for that particular date. The average number of days with minimum 32°, or lower, was only 1 day, for the State.

Precipitation during October was practically all in the form of rain, snowfall being confined to only a few flurries at a few stations, mostly in the Northern Division; the snow melted as it fell. The distribution of the rainfall was quite irregular, ranging from the State's greatest monthly amount of 6.98 inches, at Brunswick, to only 0.67 inch, at Bunker. The average for the Northern Division was 4.09 inches, or 1.42 inches more than normal; for the Southwestern Division, 2.80 inches, or 0.34 inch less than normal; and for the Southeastern Division, 2.18 inches, or 0.84 inch less than normal. Over much of the southern half of the State, the month was one of the driest Octobers of record until the last two days of the month, when moderate to heavy rainfall brought welcome relief to most of that area.

No flooding occurred in any of the major streams of the State, except locally at Louisiana, on the Mississippi River, where flood stage, or slightly higher, occurred on several days during the month.

Only two damaging storms were reported and these are described elsewhere in this issue.

Preparation for the seeding of the winter wheat crop progressed well during the month, with seeding, for the most part, being delayed until after the fly-free date for the respective localities. In much of the southern half of the State this work was delayed by the dry condition of the soil. Cribbing and feeding of early corn began during the month, but the bulk of the crop remained in the fields awaiting a heavy frost or freeze to dry it out thoroughly before picking. Practically all field crops were sufficiently matured early in the month to escape

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Ellsinore Lookout is Mill Spring; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

Continued from page 73

damage by frost or freezing temperatures. Cutting of a large crop of soybeans was completed and combining was under way the latter part of the month, under favorable weather conditions. Cotton in the southeastern counties was being picked during the month, but bolls were slow in opening and a good frost was needed to hasten opening. Pastures were in good condition over most of the northern half of the State throughout most of October, but general soaking rains were badly needed over most of the southern half to revive them and to start growth, as well as to replenish a low water supply in some areas. This much needed moisture was adequately supplied over the greater part of the dry area the last two days of this month and the first few days of November. Livestock were in good condition, as a rule, at the close of the month and supplies of feed and forage were more plentiful then in several years.—M. R. W.

TEMPERATURE

The monthly mean for the State, 97 stations reporting, was 61.1°, or 3.3° warmer than the 59-year October average. The highest monthly mean was 65.0° at Joplin, and the lowest was 56.6° at Tarkio. The highest reported was 92° at Nevada on the 7th, and the lowest 24° at Albany on the 12th and at Anderson on the 12th and 13th.

PRECIPITATION

The average for the State, 208 stations reporting, was 3.02 inches, or 0.08 inch more than the 59-year October average. The greatest monthly amount was 6.98 inches at Brunswick, and the least 0.67 inch at Bunker. The greatest amount reported in 24 hours was 4.73 inches at Brunswick, on the 17-18th. The average number of days with 0.01 inch, or more, was 6.

Only a trace of snowfall occurred, with only seven stations reporting that amount.

MISCELLANEOUS PHENOMENA

Aurora.—26th.

Earthquake.—Moderate on 7th.

Flood.—In Mississippi River, at Louisiana, flood stage, or above, occurred from the 1st to 5th; on the 8th; 13th to 18th; 22d and continued into November.

Fogs.—Heavy, 7th, 9th, 13th, 14th, 17th, 19th, 20th, 21st, 22d, 23d, 25th, 28th, 29th, 31st.

Frosts.—Light, 1st, 2d, 3d, 8th, 11th, 12th, 13th, 14th, 15th, 18th, 19th, 20th, 21st, 25th, 26th, 27th. Heavy, 1st, 2d, 3d, 12th, 13th. Killing, 1st, 11th, 12th.

Hail.—Light, 17th at Brunswick and five miles south of Appleton City; 24th at Eastwood Lookout and Joplin. Moderate, 10th and 21st at Altona.

Sleet.—11th, 12th, 17th.

Tornado.—17th. (See special storm table).

Windstorms.—17th. (See special storm table).

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports. respectively. * Included in next measurement.

Missouri Storms, October 1946

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
St. Louis City	17	7:30 p.m. to 10:30 p. m.	Strong gusty wind	SW.	....	....	0	minor	Wires and tree limbs blown down and a few shingles torn from roofs in some sections of the city.
St. Clair	17	About 3:00 p.m. to 3:30 p.m.	Local tornado	SW.	¼	About 5	0	Not reported	A small local tornado struck the vicinity about five miles south of Appleton City, resulting in considerable damage to buildings on two farms and to standing timber and orchards. Ten acres of shock corn and corn in fields were damaged. Two steers were killed and a few injured. About 100 chickens were also killed. Thirty tons of stacked hay and an unknown amount of hay in barns were damaged. Storm was accompanied by light hail and heavy rain.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

VOL. L NOVEMBER 1946 No. 11

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

This month was the wettest November in the 59 years that State-wide records have been kept for Missouri. It was also a very mild month and at many stations killing frost did not occur until the 11th or 12th, making the 1946 growing season one of the longest, if not the longest, of record at many stations.

The unusually mild weather was general over the entire State, with the Southeastern Division having the highest monthly average, 49.4°, which is 3.3° warmer than normal. The average for the Southwestern and Northern divisions was 47.5° and 44.1°, or 1.5° and 1.8°, respectively, warmer than normal. Only a very few individual stations, in widely separated sections of the State, had monthly averages slightly lower than normal. An unusually mild period prevailed the last two or three days of the month, over the southern and eastern portions of the State, maximum temperatures registering in the high 60's or low 70's on the 28th and 30th, which was the highest of record for the latter date at some stations. The minimum temperature of 13°, for this month, was the highest minimum recorded for November since 1934 and a higher minimum for that month has been recorded only eight times in the past 59 years. However, the all-time extremes of 90° and 9° below zero for the month remained unbroken. Minimum temperatures of 32°, or lower, occurred on an average of 12 days this month, for the State as a whole.

The month's precipitation was practically all in the form of rain, snowfall during the month being very light, local, and of little consquence. Only three stations, all in the extreme northwestern corner of the State, had more than a trace of snow. The greater part of the monthly precipitation occurred during the first half of the month; many stations, particularly in the Northern half of the State, received very little or no precipitation during the last half of November. The distribution was very irregular, ranging from 13.89 inches at Wasola to only 0.43 inch at Lexington. The Southwestern Division had the greatest monthly average, 8.03 inches, or 5.37 inches more than normal. The average for the Southeastern Division was 7.73 inches, or 4.47 inches more than normal. The Northern Division was relatively dry, by comparison, with only 3.57 inches; this is 1.35 inches above the average for that division. A number of stations in the southern half of the State received more than ten inches of rain during the month. The severe and persistent drought, which had prevailed continuously since July in the extreme southwestern corner of the State, was completely broken by heavy and frequent rains the first few days of November, after which there was too much moisture. Greatest 24-hour amounts of rainfall occurred on October 31st-November 1st, when 7.71 inches fell at Caplinger Mills, 6.12 inches at Hermann, and 5.33 inches at Owensville; these were the greatest amounts recorded for 24 hours in each of the three divisions of the State. Heavy rains which began the last of October continued with monotonous frequency the first ten days of November and caused rapid rises in most streams of the southern and eastern portions of the State, with moderate overflows in the Osage and Meramec rivers, and a minor overflow in the lower Missouri River.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Perry is Center; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

Continued from page 81

There were no damaging storms of any kind reported.

Frequent rains the first half of the month curtailed most field work and outdoor activities, but the latter half was more favorable and seasonable and outdoor work was resumed. Seeding of the winter wheat crop was completed as soon as the ground became dry enough and much fall plowing was accomplished. Early seeded small grains and pastures were greatly benefited by the mild, wet weather during the first half of the month and made excellent growth, thus providing abundant grazing for livestock; consequently very little dry feeding was necessary. Since there was no snow cover, grazing was possible throughout the month, except where fields were too soft from the frequent rains the first part of the month.

Threshing and combining of soybeans and lespedeza were mostly finished during the month with a record-breaking production of soybeans reported. Corn husking and cribbing made good progress the latter half of the month; yields were running high and quality good to excellent. There was practically no soft corn this year, as all of the crop matured before the first killing frosts or freezing temperatures, which occurred unusually late this fall, as a rule. Cotton picking was delayed by wet weather during much of the month, but was in full swing and about one-half completed at the close. All short water supplies were more than adequately replenished the first day or two of November, after which there was too much moisture until after the middle of the month. There was very little freezing of the soil during November and at the close of the month there was no freeze in the ground, except at a few extreme northern stations.—M. R. W.

TEMPERATURE

The monthly mean for the State, 100 stations reporting, was 47.0°, or 2.5° warmer than the 59-year November average. The highest monthly mean was 55.0° at Caruthersville, and the lowest was 40.8° at Unionville. The highest reported was 81° at Poplar Bluff on the 1st, and the lowest 13° at Albany on the 26th.

PRECIPITATION

The average for the State, 209 stations reporting, was 6.44 inches, or 3.73 inches more than the 59-year November average. The greatest monthly amount was 13.89 inches at Wasola, and the least was 0.43 inch at Lexington. The greatest amount reported in 24 hours was 7.71 inches at Caplinger Mills on Oct. 31st-Nov. 1st. The average number of days with 0.01 inch, or more, was 10.

Snowfall averaged only a trace, or 1.0 inch less than the 57-year November normal. The greatest monthly amount was 1.0 inch at Maryville.

MISCELLANEOUS PHENOMENA

Eclipse.—Solar, partial on the 23d.

Floods.—In Meramec River, at Pacific, on 4th; at Sullivan and below, 10th to 13th. In Mississippi River, at Louisiana, flood stage or higher continued from October to November 7th; also 10th to 11th; 17th to 21st; 23d to 24th; 29th. In Missouri River, in the reach from Hermann to the mouth, 2d to 5th. In Osage River, 1st to 8th; also 10th to 12th at Lakeside.

Fogs.—Heavy, 1st, 2d, 3d, 14th, 20th, 26th, 27th, 29th, 30th.

Frosts.—Light, 11th, 12th, 13th. Heavy, 11th, 12th. Killing, 10th, 11th, 12th, 13th, 17th.

Glaze.—23d, 24th, 25th, 26th.

Sleet.—9th, 11th, 24th, 25th.

Windstorms.—High wind on several days but no damaging windstorms reported.

GENERAL SUMMARY

This was the warmest December since 1931 and the fourth-warmest month of its name in the 59 years that State-wide records have been compiled. The mild, open weather, which prevailed until the 28th, was highly favorable for seasonal activities and for livestock.

The unusually mild temperatures during the greater part of the month were general over all sections of the State, and the average monthly temperature for each reporting station was well above the normal. The average temperature and departure from normal for the three divisions of the State were as follows: Southeastern 42.2°, +5.9°; Southwestern 41.9°, +6.8°; Northern 36.4°, +5.9°. For the State, as a whole, the average temperature for the month was 40.2°, +6.0°, or 12.4° above the State average temperature for December one year ago. Warm periods this month prevailed from the 3d to 12th, 15th to 16th, and 19th to 27th, with cold periods on the 1st and 2d, 13th and 14th, and the last three days of the month. The 6th, 7th and 27th were the warmest days, as a rule, with afternoon readings in the 60's and 70's, and the 30th and 31st, generally, the coldest days, with minimum readings near zero, or somewhat below, over the northern half of the State and near zero to 17° above over the southern half. These low temperatures were the result of a rather severe cold wave which entered the State on the night of the 28-29th and dominated the weather for the remainder of the month. Temperature extremes for this month were well within the range of the all-time extremes, for past Decembers.

The greater part of the month's precipitation occurred as rain. Snowfall averaged only 0.5 inch, and was the least December average for the State, since 1938. Only six other Decembers, in the past 59 years, had less snowfall than the current month. The average of only 0.5 inch for this month was in marked contrast to the State average of 7.9 inches for December one year ago, which, incidentally, was the greatest average December snowfall in the climatic history of the State. The ground was bare throughout December 1946, as a rule, except for the last three days, when amounts ranging from only a trace to as much as nearly three inches, covered the ground over most of the northern half of the State. Freezing rain and drizzle preceded the snow during the night of the 28-29th in central and northern portions of the State, covering everything with a sheet of ice, and thus seriously interfering with motor traffic and the movement of pedestrians. The month's precipitation was adequate for current needs, except in the extreme northwestern counties, where it was decidedly deficient, and the ground became very dry; there were reports of some wind erosion of the top soil in the latter area. The Southeastern Division received the greatest precipitation during December, the average being 2.95 inches, or 0.06 inch more than normal. The Northern Division had the least monthly average, 1.70 inches, or 0.12 inch more than normal. The average for the Southwestern Division was 2.66 inches, +0.60 inch. The distribution of the monthly precipitation over the State was irregular, ranging from a monthly total of only 0.02 inch at Tarkio to 5.66 inches at Hailey.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

Continued from page 89

There were no floods in any of the major streams of the State, except on the Mississippi at Louisiana, where flood stage, or slightly higher, occurred on several days during the month. As a rule, river stages were relatively low during December.

No damaging storms of any kind were reported during the month. However, the glaze formation on the 28-29th, led to a number of traffic accidents.

The mild, open weather and lack of snow cover permitted the grazing of livestock during the greater part of the month and reduced dry feeding to a minimum; this resulted in a large saving of feed and forage. Good progress was made in the gathering of the corn crop and much of this work was completed by the end of December. Wheat continued to make some growth and was still green, as a rule, until the last three days, when the cold wave stopped all growth and also curtailed outdoor work to essential chores and activities. Reserve stocks of grain and forage feed on farms and in storage at the close of December were the largest in several years. On the other hand, fuel supplies on hand and in storage during the month, in the larger cities and towns, were the lowest in many years, as a result of previous strikes in the soft coal industry. The unusually mild weather during most of December undoubtedly averted much suffering and the curtailment, or even a shut down, in industrial plants, factories and schools, because of the shortage of coal.—M. R. W.

TEMPERATURE

The monthly mean for the State, 100 stations reporting, was 40.2°, or 6.0° warmer than the 59-year December average. The highest monthly mean was 47.8° at Caruthersville, and the lowest was 32.2° at Tarkio. The highest reported was 77° at Anderson, Mount Vernon, and Ozark Beach, on the 6th, and the lowest was 8° below zero, at Conception, on the 30th.

PRECIPITATION

The average for the State, 212 stations reporting, was 2.44 inches, or 0.26 inch more than the 59-year December average. The greatest monthly amount was 5.66 inches at Hailey, and the least was 0.02 inch at Tarkio. The greatest amount reported in 24 hours was 2.85 inches at Cassville on the 9-10th. The average number of days with 0.01 inch, or more, was 5.

Snowfall averaged 0.5 inch, or 3.0 inches less than the 57-year December average. The greatest monthly snowfall reported was 2.7 inches, at Oregon.

MISCELLANEOUS PHENOMENA

Floods.—In Mississippi River, at Louisiana, flood stage, or higher, occurred on the 9th, 13th, 17th, 23d to 25th, 27th to 28th, 30th and continued into January.

Fogs.—Heavy, 6th, 9th, 10th, 11th, 12th, 15th, 16th, 20th, 26th, 27th, 28th, 29th, 30th.

Glaze.—14th, 15th, 28th, 29th.

Sleet.—12th, 13th, 14th, 20th, 21st, 28th, 29th, 30th.

Windstorms.—No damaging winds reported.

ERRATA

November 1945, page 82: Maximum temperature and date at Marshall should be 87 on the 8th.

Decemmber 1945, page 90: Minimum temperature and date at Unionville should be − 8 on 20th. Greatest 24-hour precipitation and date at Jackson should be 0.70 on 27th.

ST. LOUIS, MO.

Vol. L ANNUAL SUMMARY 1946 No. 13

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

The year 1946, as a whole, was considerably warmer than normal, in fact there have been only three years since records began in 1888 with higher annual average temperatures. May, August and September were the only months with subnormal mean temperatures, while February, March and December were abnormally warm, March in particular, it being second-warmest month of that name, on record. The highest temperature recorded, 111°, exceeded that for any year since 1940. The average precipitation this year, 44.18 inches, was more than the long-time annual average, but considerably less than the year previous (53.26 inches). There was a marked variation in the annual totals and also the greatest and least monthly amounts for individual stations, for example Summersville with the greatest annual total, 64.24 inches, had more than twice as much as Lexington's total, 30.39 inches. Monthly amounts ranged from 20.45 inches at St. Louis, in August, to only a trace at Joplin, in July. The St. Louis August total set a new record for that station, for a single month; length of record, through 1946, is 110 years. Paradoxically, Joplin, with the least monthly amount this year holds the State record for greatest amount of rain in a single month, namely 25.54 inches set in May 1943. Too, that station is located in the extreme southwestern portion, where a severe drought prevailed in August and continued until the first few days in November, when generous rains brought relief.

Excessive rains, falling over a large area, including central and east-central portions of Missouri and extending into west-central Illinois, from August 13th to 16th, inclusive, resulted in heavy property damage, enormous soil erosion and the loss of three lives, through drowning. In downtown St. Louis 13.57 inches of rain fell in a 48-hour period, on August 14-16th, to set a new St. Louis record for that interim. Damage in the city and in St. Louis County, from the unprecedentedly heavy rains and attendant wind and thunderstorms was estimated at $100,000. The bulk of the damage resulted from fires started by lightning striking several downtown St. Louis buildings.

Snowfall for the year averaged only 4.1 inches, the least since the records began 53 years ago, 13.5 inches less than the normal for a year, and 15.5 inches less than in 1945.

The first four months of 1946 (January-April) were the warmest, for a comparable period, in the 59 years that State records have been kept and as a result field and garden crops developed rapidly. By the close of April all vegetation was about a month in advance of normal. Strawberries were being picked in the extreme southern counties at the close of April, the first cutting of alfalfa had been harvested by the second week of that month and blue grass was heading in northwestern counties the last two weeks, the earliest this crop had ever headed according to best authority.

No major floods occurred this year, but moderate overflows occurred on several streams from January to August, inclusive, and again in November. Tornadoes occurred in May, June, August and October. There were no fatalities, but 17 persons were injured and aggregate property damage was somewhat in

(Continued on page 104)

CONDENSED STATE SUMMARY FOR 1946

Month	Temperature				Precipitation

(Continued from page 97)

excess of one million dollars. Damage as a result of hail and windstorms was relatively slight. Details of the individual storms will be found in the respective monthly issues of Climatological Data for 1946.

Slight earthquakes were felt over small areas of the State on May 15th and October 7th. No damage resulted. A rather general duststorm, borne by high southwesterly winds, swept over the State on February 5th, reducing visibility to less than one mile in some places and to less than a quarter of a mile for a time, at Browning. A young girl was struck and killed by lightning, near Gideon, New Madrid County, on July 8th.

TEMPERATURE

The annual mean temperature for the State was 57.8°, or 2.6° above than the 59-year normal. The highest annual mean was 62.0° at Caruthersville, and the lowest annual mean was 52.6° at Unionville. The highest temperature recorded was 111° at Clinton and Warsaw on August 8th, and the lowest was 15° below zero at Tarkio on January 1st.

PRECIPITATION

The average annual precipitation for the State was 44.18 inches, or 3.68 inches more than the 59-year average. The greatest annual amount was 64.24 inches at Summersville, and the least annual amount was 30.39 inches at Lexington. The greatest local monthly amount was 20.45 inches at St. Louis City in August, and the least local monthly amount was a Trace at Joplin in July. The greatest amount in 24 hours was 8.78 inches at St. Louis City on August 15-16th. The average number of days with 0.01 inch, or more, was 91, or one day more than normal.

The average annual snowfall for the State was 4.1 inches, or 13.5 inches less than the 53-year average. The greatest annual snowfall was 11.3 inches at St. Louis Airport, and the least annual amount was none at Round Spring. The greatest monthly snowfall was 10.0 inches at Van Buren in February.

ERRATA

Annual 1945, page 98: Annual mean temperature at Albany should be 51.5. Number of days with precipitation 0.01 inch or more at Marshall and Seligman should be 98 and 100, respectively. Page 102: mean temperature at Albany for October should be 54.4.

January 1946, page 2: Date of greatest 24-hour precipitation at Doniphan, Marshall, and Neosho should be 8th, 4-5th, and 4-5th, respectively. Page 3: Date of greatest 24-hour precipitation at Poplar Bluff should be 8th. Date of minimum temperature at West Plains should be 27th.

February 1946, page 10: Number of days with precipitation 0.01 inch or more at Chillicothe and Lexington should be 4 and 3, respectively. Mean temperature and departure at Greenville should be 42.2° and +6.4, respectively.

March 1946, page 18: Maximum temperature at Eldon and Mount Vernon should be 84° and 87 on the 31st, respectively. Page 19: Prevailing wind direction at West Plains should be se.

April 1946, page 26: Number of clear days at Warrenton should be 16. Mean temperature and departure at Warrensburg should be 60.7° and +4.6, respectively. Page 31: mean minimum at Warrensburg should be 49.5°.

August 1946, page 58: Mean temperature at Sweet Springs should be 75.1.

October 1946, page 78: Amount of evaporation at St. Louis (Washington University) on 17th should be .119; monthly evaporation should be 3.115.

December 1946, page 89: Percentage of sunshine at Springfield should be 44.

ST. LOUIS, MO.

Vol. LI — January 1947 — No. 1

Price: 5 Cents a Copy; 25 Cents a Year

GENERAL SUMMARY

The month averaged considerably warmer and somewhat drier than normal, for the State as a whole, as well as by divisions. It was an unfavorable month for outdoor work, being too cold, with snow covered ground the first week or ten days and too muddy and wet, from alternate thawing and freezing, most of the remainder of the month.

The cold wave that began on the 28-29th of the preceding month became intensified the first few days of January, culminating in the coldest weather of the winter, to date, on the 4th, when minimum temperatures ranged from 28° below zero in the extreme northwestern corner of the State to 19° above zero in the extreme southeastern corner. The extreme low temperature of 28° below zero, at Tarkio, on the 4th, was the lowest temperature experienced in Missouri since January 22d, 1930, when 31° below zero was recorded at Neosho, with the exception of January 26th, 1940, when a minimum temperature of 28° below zero was recorded at St. Joseph Airport. There have been only 11 prior occurrences in the past 60 years when the temperature dropped as low, or lower, than it did this month. After the 6th, the temperature moderated rapidly and daily averages were well above normal, as a rule, until the last two days of the month when the averages were slightly below normal. The usual "January thaw", came about 10 days to two weeks earlier than normal this year, beginning on the 7th and continued, generally, throughout the remainder of the month. It is during this period of temperature moderation, generally referred to as the "January thaw" that all, or most, of the freeze usually goes out of the ground and the ice in creeks and rivers breaks up or moves out. Also, during this period fields become extremely soft, dirt roads impassable and mud gets "shoe-top" deep. Such were the general conditions over the State during January, after the first week. The average temperature excess was uniformly distributed over the State, each of the three divisions averaging approximately 4° warmer than normal. The 13th, 24th, 27th, 29th, and 30th, were generally the warmest days, during the month.

Although precipitation averaged one inch less than normal, the month's moisture was ample for all current requirements. The distribution was rather irregular, ranging from a monthly total of 3.38 inches at De Soto to only 0.29 inch at Tarkio. The Southeastern Division received the most precipitation during January with an average of 1.89 inches, or 1.33 inches less than normal. The average for the Northern Division was 1.13 inches, or −0.46 inch and for the Southwestern Division 0.89 inch, −1.20 inches. Snowfall was rather heavy over the northern half of the State and in west-central counties, occurring mostly during the first three days of the month. Very little snow occurred anywhere after the 3d. Over the Southeastern Division and the southern half of the Southwestern Division the month's snowfall was relatively light. Heavy local rain occurred during the night of the 29-30th in connection with the passage of several small tornadoes and generally stormy conditions over the southeastern quarter of the State. At De Soto, 1.90 inches occurred within a 24-hour period and several other stations in that area reported amounts in excess of one inch on the 29-30th.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

Continued from page 1

There were no overflows in any of the major streams of the State; however, flood stage, or slightly higher, occurred at Cairo, Ill., from the 26th to 31st.

Generally high winds, local tornadoes, and rather general occurrence of hail, mostly light, occurred during the night of the 29-30th. For details see the accompanying storm table. Glaze formation was rather general on the first three days of January, being especially heavy in the southeastern quarter of the State, making roads, highways, and streets hazardous and seriously impeding traffic.

Snow-covered ground the first week or ten days over most of the northern half of the State and wet and muddy fields during the remainder of the month, over all of the State, prevented field work and grazing of livestock, and dry feeding was necessary throughout January. At the close of the month the winter wheat crop was in good condition, having made some growth during the unusually mild weather, after the first week or ten days of the month. Some crops still remained in the fields as the month closed. Fruit buds, particularly peaches, were believed killed, or severely damaged, by the extremely low temperatures of January 4th over much of the northern and locally in central portions of the State.—M. R. W.

TEMPERATURE

The monthly mean for the State, 103 stations reporting, was 34.9°, or 4.0° warmer than the 60-year January average. The highest monthly mean was 42.8° at Caruthersville, and the lowest was 27.3° at Unionville. The highest reported was 79° at Ozark Beach, on the 29th, and at Wappapello Dam, on the 27th, and the lowest was 28° below zero, at Bethany and Tarkio, on the 4th.

PRECIPITATION

The average for the State, 213 stations reporting, was 1.30 inches, or 1.00 inch less than the 60-year January average. The greatest monthly amount was 3.38 inches at De Soto, and the least was 0.29 inch at Tarkio. The greatest amount reported in 24 hours was 1.90 inches at De Soto on the 29-30th. The average number of days with 0.01 inch, or more, was 6.

Snowfall for the State averaged 3.5 inches, or 0.9 inch less than the 56-year January average. The greatest monthly snowfall reported was 10.0 inches, at Albany.

MISCELLANEOUS PHENOMENA

Flood.—In Mississippi River, at Louisiana, continued from December 30th to January 7th, 10th to 13th, 17th to 18th, 22d to 24th, 30th; at Cairo, Ill., 26th to 31st.

Fogs.—Heavy, 2d, 4th, 6th, 7th, 9th, 10th, 11th, 12th, 13th, 14th, 15th, 16th, 17th, 21st, 23d, 24th, 25th, 29th, 30th.

Glaze.—1st, 2d, 3d, 4th, 5th, 6th, 7th, 12th, 15th, 19th, 20th, 25th, 29th, 30th, 31st.

Hail.—Light, 13th at Amity; 29th at Carrollton, near Columbia, Fulton, Grant City, Kansas City University, Kidder, King City, Maryville, New Florence, Shelbina, Steffenville, Vandalia, Butler, Elijah, Harrisonville, Jefferson City, Joplin, Marshall, Neosho, Springfield, Sweet Springs, Warrensburg, Westphalia, Alton, Eastwood Lookout, Koshkonong, St. Louis University, Webster Groves, Weingarten. Moderate, 29th at Canton, Oregon, Seymour. Heavy, 29th at Altona, Boonville, Pleasant Hill, Greenville.

Sleet.—1st, 2d, 3d, 4th, 6th, 7th, 9th, 12th, 15th, 16th, 19th, 20th, 29th, 30th.

Tornado.—29th (See special storm table).

Windstorm.—29th. (See special storm table).

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Windshield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. (C) Airport.
‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for January 1947

(See precipitation data in daily precipitation table)

Missouri Storms, January 1947

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Howell, Oregon, Shannon and Carter	29	6:00 p.m. to 7:30 p.m.	Tornadoes	sw.	¼ to 1¼	Varied from 6 to 45	6	Not reported	A group of four separate tornadoes which struck the extreme south-central portion of Missouri during the early evening of January 29th killed 6 persons, injured 25 others, destroyed 173 buildings and damaged 257 others, killed 34 head of cattle, 10 sheep and 17 other animals, 1,800 chickens and other poultry and destroyed or damaged much timber. All of the storms occurred in sparsely settled farm communities and timbered areas, no towns or cities being hit, except the residential area of West Plains. The movement of each of the tornadoes was from the southwest to northeast over paths of varying width and length. One tornado and the first of the four to develop and strike the State crossed the Missouri-Arkansas boundary at a point about 13 miles west of Thayer, Mo. at about 6:15 p. m. and moved northeastward through timber land to about 3 miles southwest of Koshkonong where it lifted and disappeared. This was the same tornado that struck the town of Salem, Ark. at about 6:00 p. m. and resulted in severe damage at that place. In Missouri the damage from this tornado was to timber and some barns. A second tornado struck 2 miles north of Pomona at approximately 6:00 p. m. and moved northeastward a distance of about 6 miles where it lifted and disappeared before reaching highway 60, east of Hutton Valley. Several houses and barns were either completely destroyed or badly damaged by this storm, and one person was injured. The third of the group of tornadoes also struck at about 6:00 p. m. about 4 miles southeast of Thayer and moved northeastward to near Van Buren, a distance of approximately 45 miles, over a path about one mile wide. One person was killed by this storm and 19 were injured. The Red Cross reported 115 buildings destroyed and 215 damaged in Oregon County and damage to buildings and timber in Carter County by this storm as well as 32 head of livestock and 1,200 head of poultry killed in Oregon County. At about 7:00 p. m. the fourth and last of the series of tornadoes struck 8 miles south of Mountain View and ½ mile west of the Shannon-Howell County boundary and moved northeastward to within 3 miles south of Teresita and crossed highway 60 one mile west of Montier, thence to Alley Springs and to the north of Eminence before it lifted and disappeared, a total distance of about 30 miles. Five persons were killed and five were injured by this tornado in the Montier area. Fifty-eight buildings were destroyed, 42 others damaged, 29 head of livestock and 600 head of poultry killed according to Red Cross reports. Damage in the Winona Forest Service district was estimated at $20,000. (Acknowledgement for descriptive accounts of these tornadoes is hereby made to Mr. K. R. Kiser, Field Inspector of the K. C. R. O. who was on inspection duty in the area at the time they occurred).
Butler, Crawford, St. Louis, and City of St. Louis........	29	Early evening and during night	Wind and thunderstorms	sw.	....	....	1	Total damage unknown but in excess of $150,000	High, gusty winds accompanied by thunderstorms occurred over a large portion of the State and particularly the southeastern quarter and resulted in the death of one person and injury to at least two others with extensive property damage. Practically no crop damage, other than to trees, occurred due to to the season of year. Near Steelville one woman was burned to death when her home was collapsed by the wind and it caught fire. Another person in that area was injured. At Poplar Bluff damage to one house and several outbuildings was estimated at $1,200. At St. Louis and in St. Louis County heavy damage was done to buildings, many plate glass windows, power and communication lines and poles, trees, roofs, billboards and signs. At Affton the damage was estimated at more than $100,000. One person was injured slightly in the City of St. Louis. The storm extended northeastward into Illinois.
Cass...............	29	5:05 p.m. to 5:15 p.m.	Heavy hail	w.	1	Unknown	0	$50	Storm struck Pleasant Hill over an area of about one square mile and was accompanied by high wind. Stones were ⅜ inch in diameter and covered the ground to a depth of 1½ inches. Roofs were damaged slightly and holes were torn in old automobile tops. No glass was broken due to small size of the stones. There was no crop damage.

GENERAL SUMMARY

This was the driest February in the 60 years that State-wide records have been kept; also, it was the coldest month of its name since 1936. Only one other month, November 1904, has averaged drier than the current month, since the climatic history of the State began in 1888. Precipitation for the first two months of the current year averaged 1.56 inches, the second driest January and February, combined, of record; the driest comparable two consecutive months was in 1943, when the average precipitation was only 1.33 inches.

Temperature extremes were not unusual during the month, being well within the extremes of past Februarys. However, the averages for the month ranged from 4.0° to 6.0° below normal in each of the three divisions of the State and at some individual stations the monthly average was 9.0°, or more, below normal. The averages and departures by divisions were as follows: —Northern 25.7°, —4.2°; Southwestern 30.1°, —4.2°; Southeastern 30.7°, —6.2°; for the State 28.8°, —4.5°. The 13th, 14th, 15th, and 16th were the warmest days during the month and the 7th, 8th, 9th, and 10th the coldest days. The average number of days, with minimum temperature 32°, or lower, was 26.

Precipitation during the month occurred almost entirely in the form of snow. Many stations, particularly in the Northern Division, did not have measurable precipitation until the 28th, when the only general precipitation of the month occurred. Several stations in the northeastern quarter of the State reported no precipitation at all during the entire month. Snowfall during February was light and quickly melted, and the ground was not covered for more than one day at any place, as a rule. On the 28th, a general heavy snowfall began, which continued into March, with depths ranging up to 6 and 7 inches in some central sections of the State, before it ended. The distribution of the month's precipitation and departure from normal, by divisions, was as follow: —Northern 0.11 inch, —1.45 inches; Southwestern 0.31 inch, —1.67 inches; Southeastern 0.35 inch, —2.37 inches; for the State 0.26 inch, —1.83 inches.

There were no damaging storms of any kind during the month and no floods occurred in any of the major streams of the State.

The dry cold weather was favorable for seasonal outdoor work. A few oats were sown, locally, the latter part of the month. Wheat was apparently in good condition at the close of February, but remained dormant, generally, throughout most of the month. The low temperatures also kept fruit buds dormant during February. The absence of snow cover permitted grazing and foraging of livestock throughout most of the month, except when fields were muddy from alternate thawing and freezing. Water supplies were getting low in some areas of the State as the month closed and more moisture was needed quite generally.—M. R. W.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period: for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

Continued from page 9

TEMPERATURE

The monthly mean for the State, 103 stations reporting, was 28.8°, or 4.5° colder than the 60-year February average. The highest monthly mean was 35.9° at Caruthersville, and the lowest was 20.6° at Unionville. The highest reported was 73° at Cape Girardeau on the 14th, and the lowest was 8° below zero at Conception on the 7th.

PRECIPITATION

The average for the State, 212 stations reporting, was 0.26 inch, or 1.83 inches less than the 60-year February average. The greatest monthly amount was 1.12 inches at Ozark, and the least was none at Madison, Palmyra, Perry, and Shelbyville. The greatest amount reported in 24 hours was 0.71 inch at Joplin Airport on the 27-28th. The average number of days with 0.01 inch, or more, was 2.

Snowfall averaged 3.5 inches, or 1.5 inches less than the 56-year February average. The greatest monthly snowfall reported was 10.7 inches at West Plains.

MISCELLANEOUS PHENOMENA

Aurora.—16th.

Dust.—3d, 6th, 7th.

Fogs.—Heavy, 11th, 12th, 13th, 15th, 17th.

Glaze.—1st, 20th, 28th,

Meteor.—18th; observed locally at Seymour.

Sleet.—6th, 18th, 28th.

Windstorm.—High winds reported on several days, particularly 6th and 7th, but no damage reported.

29 1947

GENERAL SUMMARY

March 1947 was a decidedly cold month, with unusually heavy snowfall and a very unfavorable month for seasonal plowing and planting operations. This work was two weeks, or more, behind normal advancement at the close of the month, and was in marked contrast to the same month a year ago, which was the second warmest March of record, with very little snowfall, and all vegetation and field work were about four weeks ahead of normal advancement as that month closed.

This month was the coldest March since 1915 and the 7th coldest of its name of record (1888-1947). Although no unusually low temperatures were reported, 7° below zero being the lowest for the entire State, the cold was persistent and daily averages were generally well below normal throughout the entire month, except for brief periods from the 11-13th and 22-23d, when normal or above occurred. The maximum temperature of 77° was the third lowest maximum for March in the past 60 years. Minimum temperatures of 32°, or lower, occurred on an average of 23 days this month, compared to only 4 days during March a year ago. The 3d was the coldest and the 22d the warmest day of the month, as a rule. Average temperatures for March by divisions, with departures from normal, were as follows: Northern, 34.8°, —6.6°; Southwestern, 38.3°, −7.1°; Southeastern, 39.1°, −7.7°; for the State, 37.4°, —6.7°.

Precipitation during March was from both rain and snow and was rather unevenly distributed, ranging from a total of 5.58 inches at Polo, to only 1.12 inches at Doniphan. Although the average for the State was slightly below normal, the frequency of the month's precipitation kept the soil too wet to work during most of the time, rain or snow occurring on an average of 11 days, or 3 more than normal for March. The Northern Division received the most moisture during the month, with an average of 3.26 inches, or 0.69 inch more than normal. The averages and departures for the Southwestern and Southeastern Divisions were 2.97 inches, —0.15 inch and 2.16 inches, −1.85 inches, respectively. This was the third consecutive month that the precipitation averaged less than normal, for the State as a whole. Snowfall during March was unusually heavy, particularly over the Northern Division, where monthly totals ranged from about 4 to as much as 26 inches, the latter amount being recorded at Mexico, Audrain County. Average snowfall for the State was 8.8 inches, the third heaviest in the 57 years for which records are available and the greatest March average since 1931, when the average for the State was also 8.8 inches. Over much of the central portion of the State the ground was covered with 6 to 7 inches of snow during the first few days of the month, which did not entirely melt until after the first week, as a rule. Subsequent snowfall during the month melted rather quickly and the ground was not covered anywhere for more than a day or two at any time. At St. Joseph the greatest 24-hour snowfall of record, for that station, occurred on the 5th, when a total of 11.2 inches was recorded.

There was only one damaging storm reported during March, which is rather unusual for that month. (For details see special storm table).
